

ASG-Tracer[®] Enhancement Summary

Version 7.3

September 26, 2002
TCR1000-730

ASG-Tracer Version 7.3 (herein called Tracer) contains these enhancements:

- The Tracer Summary Report
- A utility program that builds the JCL necessary to run database sweeps for CA-IDMS relocated records

Tracer Summary Report

The Tracer Summary Report contains summary counts of the number of records that were updated both by individual programs and by types of update verbs. The counts are broken down by record-type, user ID, and parameter settings. The report of record update counts is useful for performance tuning and for data replication.

TCRJCLBD Program

The TCRJCLBD program is contained in the JCL job @RABJCLB. This job executes the program TCRJCLBD that builds the multiple step JCL necessary to run the program TRSR2SWE, which sweeps through a CA-IDMS database looking for SR2 and SR3 relocated records. The job @RABJCLB creates the JCL that eliminates the need to manually modify and submit the current job @RA0BSWE that also runs the program TRSR2SWE.

Tracer also contains another new job: @RAALOOK. This job executes the CA-IDMS utility IDMSLOOK and is used to support @RABJCLB. The output of this job is used as input to the @RABJCLB job.
