2101 CityWest Blvd.  
Houston TX 77042-2827  
USA

---

## Contacting BMC Software

You can access the BMC Software Web site at <http://www.bmc.com>. From this Web site, you can obtain general information about the company, its products, special events, and career opportunities. For a complete list of all BMC Software offices and locations, go to <http://www.bmc.com/corporate/offices.html>.

### USA and Canada

**Address** BMC Software, Inc.  
2101 CityWest Blvd.  
Houston TX 77042-2827

**Telephone** 713 918 8800 or  
800 841 2031

**Fax** 713 918 8000

### Outside USA and Canada

**Telephone** (01) 713 918 8800

**Fax** (01) 713 918 8000

## Customer Support

You can obtain technical support by using Response Online™ (comprehensive information from the Web) or Response On Demand™. To expedite your inquiry, please see “Before Contacting BMC Software,” below.

### Response Online

You can obtain technical support from BMC Software 24 hours a day, seven days a week by accessing the technical support Web site at <http://www.bmc.com/support.html>. From this site, you can

- read overviews about support services and programs that BMC Software offers
- find the most current information about BMC Software products
- search a database for problems similar to yours and possible solutions
- order or download product documentation
- report a problem or ask a question
- subscribe to receive e-mail notices when new product versions are released
- find worldwide BMC Software support center locations and contact information, including e-mail addresses, fax numbers, and telephone numbers

### Response On Demand

In the USA and Canada, if you need technical support and do not have access to the Web, call 800 538 1872. Outside the USA and Canada, please contact your local support center or your local sales office for assistance.

### Before Contacting BMC Software

Before you contact BMC Software, have the following information available so that a technical support analyst can begin working on your problem immediately:

- product information
  - product name
  - product version (release number)
  - license number and password (trial or permanent)
- operating-system and environment information
  - machine type
  - operating system type, version, and service pack or program temporary fix (PTF)
  - system hardware configuration
  - serial numbers
  - related software (database, application, and communication) including type, version, and service pack or PTF
- sequence of events leading to the problem
- commands and options that you used
- messages received (and the time and date that you received them)
  - product error messages
  - messages from the operating system, such as `file system full`
  - messages from related software

## Part 1. Using MAINVIEW for DB2..... 1

<b>Chapter 1. Introduction</b> .....	3
DB2 Online Performance Analysis .....	3
Current Status and Activity .....	3
Exception Monitoring .....	3
DB2 Tuning Wizards .....	4
Complete System Management .....	4
DB2 Catalog and Table Access .....	4
DB2 Application and Workload Analysis .....	5
Application Trace .....	5
Workload Analysis .....	5
Historical Analysis .....	6
Trace Logs .....	6
Online Views .....	6
DB2 Tables .....	6
Operations Control/DB2 Console .....	7
MAINVIEW Product Integration .....	8
<b>Chapter 2. Signing On to MAINVIEW for DB2</b> .....	11

---

## Part 2. Using Views and Wizards ..... 15 |

<b>Chapter 3. Introduction to Views and Wizards</b> .....	17
<b>Chapter 4. Getting Started with Windows Mode</b> .....	19
Accessing Windows Mode .....	19
Accessing Views .....	20
Easy Menus .....	21
EZDSSI—Monitor Multiple DB2s .....	21
EZDB2—Monitor One DB2 .....	22
EZDBA—Applications Menu .....	23
Other DB2 Easy Menus .....	23
Integrating Views with Other MVDB2 Services .....	24
Hyperlinks .....	24
Transfers .....	24
Return .....	24
Monitor Data .....	24
Integrating Views with Other MAINVIEW Products .....	25
Screens with Multiple Products .....	25
Product Transfers to Windows Mode .....	25
VistaPoint Workloads .....	25
<b>Chapter 5. Using the DB2 Tuning Wizards</b> .....	27
<b>Chapter 6. Viewing DB2 Performance Over Different Time Periods</b> .....	29
Data Collection Periods .....	29
Historical Data .....	30

---

<b>Part 3. Managing Views</b> .....	31
<b>Chapter 7. Defining a DB2 Workload</b> .....	33
Planning a DB2 Workload Definition .....	33
Default Workloads .....	33
Establishing Workload Conventions .....	34
Shared BBPARM Library .....	34
Naming Conventions .....	34
Identifying Critical Workload Monitoring Periods .....	34
DWKLDDEF—DB2 Workload Definition .....	35
Using the DB2 Workload Definition Dialog .....	36
Saving and Installing the DB2 Workload Definition .....	37
DWKLDDET—DB2 Workload Definition Detail .....	38
<b>Chapter 8. Using SSI Contexts</b> .....	39
Using Commands to Change Context .....	39
CONtext Command .....	39
SET Command .....	39
SETD Command .....	40
SCOPE Command .....	40
Plex Manager Views of SSI Contexts .....	40
<b>Chapter 9. Securing Resources</b> .....	41
SERDEF—Security Resource Definitions .....	41
SERDEFE—Security Resource Definition Detail .....	43

---

**Part 4. Analyzing DB2 Performance** ..... 45

<b>Chapter 10. Alphabetical List of Views</b> .....	51
<b>Chapter 11. DB2 Systems</b> .....	65
DB2 System Status Views .....	75
STDB2—DB2 Activity Overview .....	75
STDB2D—DB2 Status Detail—Interval .....	76
STDB2DS—DB2 Status Detail—Session .....	78
STEXC—Exception Conditions .....	80
STWARN—Warning/Error Conditions .....	81
STRATE—Activity Rates .....	83
STDB2SYS—DB2 System Information .....	84
STDBSYS—DB2 System Information Detail .....	85
STQPAR—Query Parallelism .....	86
STQPARD—Query Parallelism Detail .....	87
STCMDS—DB2 Commands .....	88
STCMDS—DB2 Commands Detail .....	89
User Activity Views .....	90
STUSUMM—User Summary .....	90
STUSUMMD—User Summary Detail .....	90
STSQL—SQL Counts .....	91
STSQLD—SQL Counts Detail .....	92
STAGENT—Agent Services .....	93
STAGENTD—Agent Services Detail .....	93
STSERSV—Subsystem Services .....	94

STSERVD—Subsystem Services Detail . . . . .	95
STBIND—Bind Statistics . . . . .	96
STBINDD—Bind Statistics Detail . . . . .	97
STAUTH—Authorization Checks . . . . .	98
STAUTHD—Authorization Checks Detail . . . . .	99
STROUT—Routine Statistics . . . . .	100
STROUTD—Routine Statistics Detail . . . . .	101
Lock Views . . . . .	102
STLOCK—Lock Statistics . . . . .	102
STLOCKD—Lock Statistics Detail . . . . .	103
STGBLLK—Global Locking . . . . .	104
STGBLLKD—Global Locking Detail . . . . .	105
Pool/Page Set Views . . . . .	106
STBFRPL—Buffer Pool Statistics . . . . .	106
STBFRPLD—Buffer Pool Statistics Detail . . . . .	107
STHITR—Hit Ratios . . . . .	108
STHITRD—Hit Ratios Detail . . . . .	108
STGBFRPL—Global Buffer Pool Statistics . . . . .	109
STGBFRPD—Global Buffer Pool Statistics Detail . . . . .	110
STGBGRPD—Global Buffer Pool Group Statistics Detail . . . . .	114
STRID—RID Pool Statistics . . . . .	115
STRIDD—RID Pool Statistics Detail . . . . .	115
STDSA—Data Set Activity . . . . .	116
STDSAD—Data Set Activity Detail . . . . .	116
EDM Pool Views . . . . .	117
STEDMP—EDM Pool Statistics . . . . .	117
STEDMPD—EDM Pool Statistics Detail . . . . .	118
Logging Views . . . . .	119
STLOG—Log Statistics . . . . .	119
STLOGD—Log Statistics Detail . . . . .	120
STCHKP—Checkpoint Data . . . . .	121
STCHKPD—Checkpoint Data Detail . . . . .	121
DDF Views . . . . .	122
STDDF—DDF Statistics . . . . .	122
STDDFD—DDF Statistics Detail . . . . .	123
STDIST—DBAT Statistics . . . . .	124
STDISTD—DBAT Statistics Detail . . . . .	125
<b>Chapter 12. Buffer Pools . . . . .</b>	<b>127</b>
Local Buffer Pool Views . . . . .	132
BFRPL—Buffer Pool Statistics—SSI . . . . .	132
BFRPLD—Local Buffer Pool Statistics Detail . . . . .	133
BFRPLH—Buffer Pool Rates—SSI . . . . .	134
BFRPLHD—Buffer Pool Rates Detail . . . . .	135
Global Buffer Pool Views . . . . .	136
GBPGSTZ—Group Buffer Pool Group Coupling Facility Status . . . . .	136
GBPGSTD—Group Buffer Pool Group Coupling Facility Status Detail . . . . .	137

<b>Chapter 14. Threads . . . . .</b>	<b>181</b>
Thread Summary Views . . . . .	184
THDCONNZ—Thread Summary by Connection . . . . .	184
THDCTYPZ—Thread Summary by Connection Type . . . . .	185
THDDDB2Z—Thread Summary by DB2 ID . . . . .	186
THDPLANZ—Thread Summary by Plan Name . . . . .	187
THDPRLLZ—Summary of Parallel Queries . . . . .	188
THDUSERZ—Thread Summary by User ID. . . . .	189
Thread Detail Views . . . . .	190
THDACTV—All Active Threads . . . . .	190
THDALL—All Connected Threads . . . . .	191
THDLIST—All Active Threads—Long Form. . . . .	192
THDCICPR—CICS Protected Thread Averages . . . . .	193
THDPRLLD—Parallel Query Detail . . . . .	194
THDDETL—Thread Detail . . . . .	195
THDWARN—Key Indicator/Warnings . . . . .	197
THDWARND—Key Indicator/Warnings Detail . . . . .	198

<b>Chapter 15. Workloads</b> .....	199
Workload Objective Views .....	201
DOBJ—Objectives Review .....	201
DOBJZ—Objective Summary .....	202
<b>Chapter 16. Lockouts</b> .....	203
Lockout Event Views .....	206
LKEVENT—Lockout Events .....	206
LKEVSSI—Global Lockout Events .....	207
LKEVRES—Lockout Event Resources .....	208
LKEVD—Lockout Event Resource Detail .....	209
Resource Conflict Views .....	210
LKRESZ—Lockout Resource Summary .....	210
LKRESNRZ—Lockout Resource Number Summary .....	211
LKRESD—Lockout Resource Conflict Detail .....	212
Involved Thread Views .....	213
LKCONZ—Lockout Connection Summary .....	213
LKBWZSSI—Lockout Global Blocker/Waiter Summary .....	214
LKBWZ—Lockout Blocker/Waiter Summary .....	215
LKBLOCKZ—Lockout Blocker Plan Summary .....	216
LKBLOCK—Lockout Blocker Plan Detail .....	217
LKWAITZ—Lockout Waiter Plan Summary .....	218
LKWAIT—Lockout Waiter Plan Detail .....	219
<b>Chapter 17. ZPARM Installation Parameters</b> .....	221
DB2 System ZPARM Views .....	226
ZPDB2D—DB2 Definition .....	226
ZPSYSD—System Definitions .....	227
ZPTRACED—Trace Parameters .....	228
ZPDSHRD—Data Sharing .....	229
ZPTHDD—Thread Parameters .....	230
Locking ZPARM Views .....	231
ZPIRLMDD—IRLM Definitions .....	231
ZPIRLMLD—IRLM—Lockout Detection .....	232
Logging ZPARM Views .....	233
ZPLOGD—Active Log Definitions .....	233
ZPARCDFD—Archive Log Definitions .....	234
ZPARCALD—Archive Log Allocation Definitions .....	235
Distributed ZPARM Views .....	236
ZPDDFD—Distributed Data Facility .....	236
Storage and Data Set ZPARM Views .....	237
ZPSTGD—Storage-Related Parameters .....	237
ZPDSETD—Data Set Management .....	238
ZPBFMGRD—Buffer Manager .....	239
ZPDDLCTD—Data Definitions Control .....	240
Authorization ZPARM Views .....	241
ZPAUTHD—Authorization .....	241
ZPRLFD—Resource Limit Facility (RLF) .....	242
Application-Related ZPARM Views .....	243
ZPQPARD—Query Parallelism .....	243
ZPROUTD—Routine Parameters (Stored Procedures/UDFs) .....	244
ZPHDECPD—DSNHDECP—Application Programming Defaults .....	245
ZPSAPD—SAP R/3—Related Parameters .....	246

<b>Chapter 18. Dynamic SQL Cache</b> .....	247
Dynamic SQL Cache Statistics Views .....	250
STCACHE—Dynamic SQL Cache Statistics .....	250
STCACHED—Dynamic SQL Cache Statistics—Detail .....	251
Dynamic SQL Statement Views .....	252
SCSQL—SQL Cache Statement List .....	252
SCSTATS—SQL Cache Statement Statistics .....	253
SCWAITS—SQL Cache Statement Waits .....	254
SCLIST—SQL Cache Statement Elements List .....	255
SCSQLD—SQL Cache Statement Detail .....	256
SCSTMTD—SQL Cache Statement Text .....	257
SCSETF—SQL Cache Statements Filters .....	258
SCFTOTZ—Dynamic SQL Cache Filter Results .....	259
<b>Chapter 19. Monitors</b> .....	261
Monitor Summary Views .....	264
DMON—Target Monitor Summaries .....	264
DMAREAZ—Monitor Summary by Area .....	265
DSOVER—Monitors by Type .....	265
Monitor Detail Views .....	266
DSERV—Active Monitors .....	266
DMWARN—Monitors in Warning .....	267
Plot Views .....	268
DB2 Resource Monitors .....	269
General DB2 System Monitors (Area = DSYS) .....	269
User Activity Monitors (Area = USER) .....	270
Lock Monitors (Area = LOCK) .....	275
EDM Pool Monitors (Area = EDM) .....	277
Buffer Pool Monitors (Area = BUFR) .....	278
Log Monitors (Area = LOG) .....	291
MVS Services (Area = DMVS) .....	292
DDF Monitors (Area = DDF) .....	293
DB2 Workload Monitors .....	295
SQL Monitors (Area = WKLD) .....	295
CPU Usage Monitors (Area = WKLD) .....	296
Transaction Usage Monitor (Area = WKLD) .....	296
Buffer Usage Monitors (Area = WKLD) .....	297
Lock Usage Monitors (Area = WKLD) .....	298
Elapsed Time Monitors (Area = WKLD) .....	299
I/O Parallelism Monitors (Area = WKLD) .....	300

## About This Book

This book describes how to use the online functions of MAINVIEW for DB2. It can be used by the DB2 database administrator, system programmer, or performance analyst to control resource usage and performance. Before using this book, you must be familiar with the IBM DB2 program product.

The batch reporting functions are described in the *MAINVIEW for DB2 Performance Reporter User Guide*.

---

## How This Book Is Organized

This book is organized into three volumes:

- Volume 1: Views
- Volume 2: Analyzers/Monitors
- Volume 3: Traces

These parts are included in Volume 1:

- An overview of how to use MAINVIEW for DB2. It includes
  - An introduction describing the major functions of MAINVIEW for DB2
  - Instructions for logging on to MAINVIEW for DB2
- How to use views and wizards
- How to manage views
- A description of the views you can use to analyze DB2 performance

These parts are included in Volume 2:

- An overview of how to use the MAINVIEW for DB2 services that run in full-screen mode. It includes
  - A description of the Primary Option Menu and how to access the MVDB2 functions
  - The DB2 analyzer, monitor, and trace display services and their parameters organized alphabetically (in a tabular format with page references to the detailed service descriptions)
  - A description of the analyzers, monitors, and traces, and how they are used
  - The MVDB2 general commands and services
- The DB2 resource analyzer display services
- The DB2 resource and workload monitor data collection services

These parts are included in Volume 3:

- How to use the trace facility

- The DB2 application trace display services

Appendixes, a glossary, and an index are included in all volumes.

Throughout the body of this document, MVDB2 refers to MAINVIEW for DB2. The DMR acronym for the product is used occasionally in this book and in many online panels and messages.

---

## Conventions Used in This Book

The following syntax notation is used in this manual. Do not type the special characters.

- Brackets [ ] enclose optional parameters or keywords.
- Braces { } enclose a list of parameters; one must be chosen.
- A vertical line | separates alternative options; one can be chosen.
- An underlined parameter is the default.
- AN ITEM IN CAPITAL LETTERS indicates exact characters; usage can be all uppercase or lowercase.
- Items in lowercase letters are values you supply.

---

## Related Reading

This book is included as part of the MAINVIEW library, which documents all your MAINVIEW products and the tasks associated with using these products.

## MAINVIEW Library

The MAINVIEW library documents these products:

- CMF® MONITOR Online (CMF)
- IMSplex System Manager™ (IPSM)
- MAINVIEW® Alarm Manager (MVALARM)
- MAINVIEW® AutoOPERATOR™ (AO)
- MAINVIEW® Explorer
- MAINVIEW® FOCAL POINT™
- MAINVIEW® for CICS (MVCICS)
- MAINVIEW® for DB2® (MVDB2)
- MAINVIEW® for DBCTL (MVDBC)
- MAINVIEW® for IMS (MVIMS)
- MAINVIEW® for IP (MVIP)
- MAINVIEW® for MQSeries (MVMQS)
- MAINVIEW® for OS/390 (MVMVS)
- MAINVIEW® for UNIX System Services (MVUSS)
- MAINVIEW® for VTAM (MVVTAM)
- MAINVIEW® for Websphere
- MAINVIEW® VistaPoint™ (MVVP)
- Plex Manager (PLEXMGR)

The MAINVIEW library is organized into these three categories:

- Installer documentation
- Administrator documentation
- User documentation

Each book within these categories contains information about specific types of tasks. The following figure shows how this book relates to the other books in the MAINVIEW library.

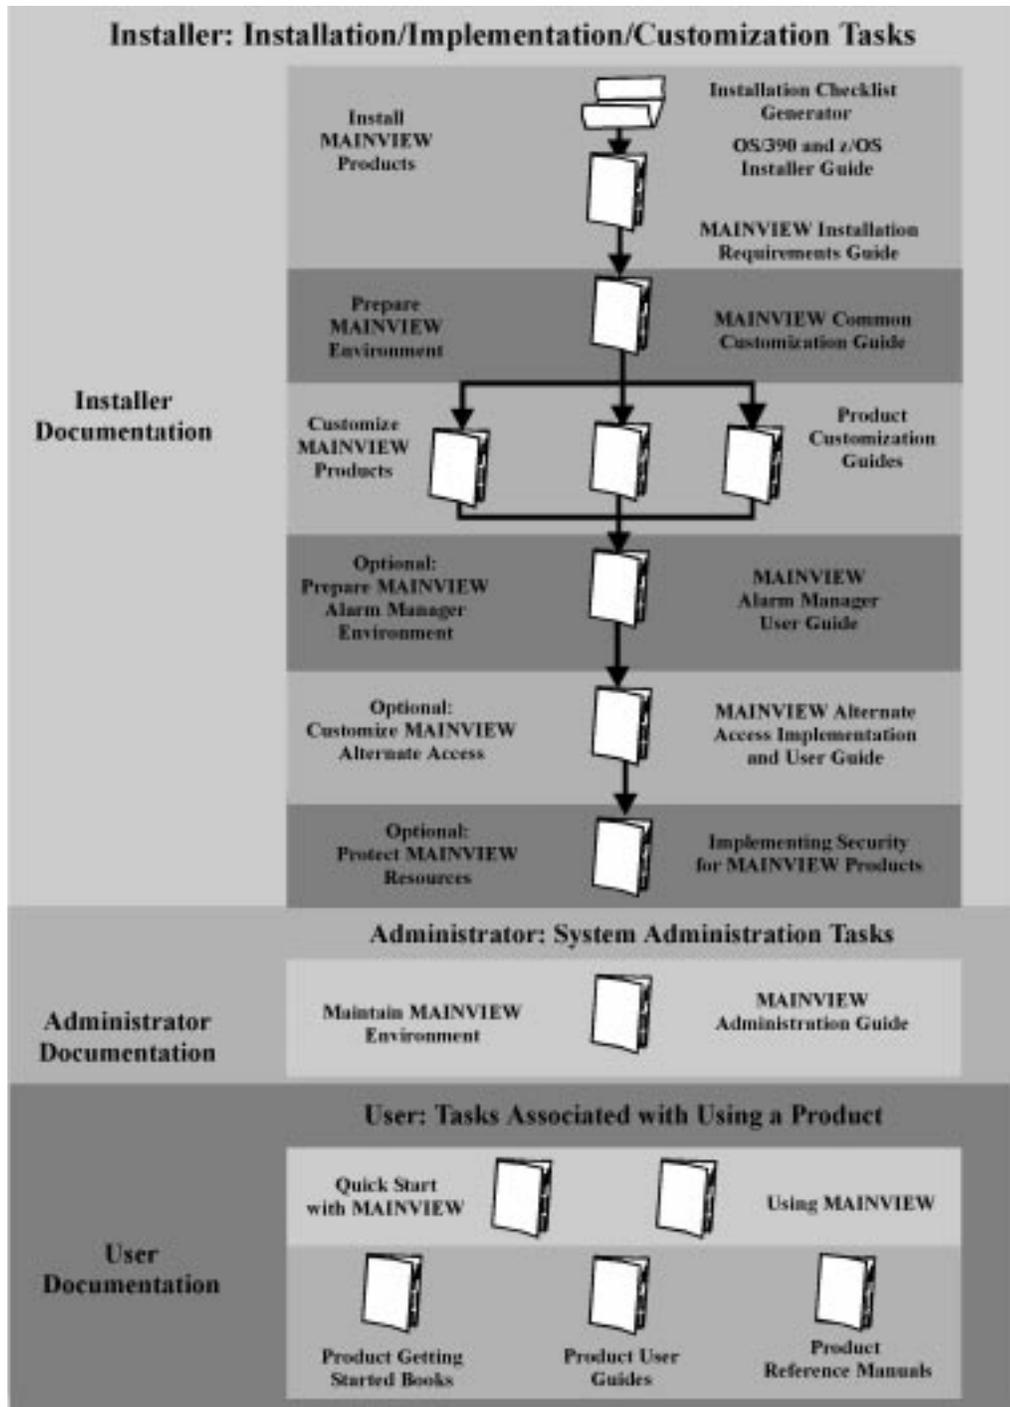

Figure 1. Organization of MAINVIEW Documentation

The following books in the MAINVIEW library are used with all MAINVIEW products:

- *Quick Start with MAINVIEW* gives a brief overview to help you quickly get started using all your MAINVIEW products.
- *Using MAINVIEW* gives a more detailed description of how to use your MAINVIEW products. If you have more than one MAINVIEW product, this book will help you understand how all your MAINVIEW products work. This book will also help you use your products together and take advantage of the integration of all MAINVIEW products.
- The *OS/390 and z/OS Installer Guide* and *MAINVIEW Installation Requirements Guide* give instructions for basic installation of the product libraries.
- The *MAINVIEW Common Customization Guide* and the *MAINVIEW Administration Guide* provide customization and administration instructions for all MAINVIEW products.
- The *MAINVIEW Alternate Access Implementation and User Guide* describes how to use the MAINVIEW Alternate Access component. This component provides EXCP and VTAM communication to BMC Software products through ISPF without requiring a TSO subsystem to be active.
- The *MAINVIEW Alarm Manager User Guide* describes how to generate alarms when thresholds from MAINVIEW product views are exceeded.
- *Implementing Security for MAINVIEW Products* describes how to implement security for MAINVIEW for DB2 with the external security manager installed at your site.
- The *MAINVIEW Explorer Implementation and User Guide* explains how to install and use MAINVIEW Explorer, which provides access to MAINVIEW products from a Web browser running on a Windows workstation.

## MAINVIEW for DB2 Library

The following documentation gives specific information about the MAINVIEW for DB2 and RxD2 products:

- *MAINVIEW for DB2 Release Notes* summarize the new features in this release of MAINVIEW for DB2 and RxD2. These notes enable you to quickly see what is new.
- The *MAINVIEW for DB2 Master Index* includes index entries for all the product-specific books in the MAINVIEW for DB2 library. This index shows where you can find information for specific topics in individual MAINVIEW for DB2 and RxD2 manuals.
- *Getting Started with MAINVIEW for DB2 and RxD2* is an introduction for new users of these products. The book helps you use these products to solve problems more effectively in a short time.
- The *MAINVIEW for DB2 User Guide* (Volumes 1, 2, and 3) describes how to use the online views, analyzer, monitor, and trace services for the DB2 database administrator, system programmer, or performance analyst.
- The *MAINVIEW for DB2 Performance Reporter User Guide* describes how to create statistical batch reports about application activity and DB2 performance and resource usage for the database administrator, system programmer, or performance analyst.

- The *RxD2 User Guide* describes how to install and use the RxD2 product, which provides access to DB2 from REXX. This product also provides tools to query the DB2 catalog, issue dynamic SQL, test DB2 applications, analyze EXPLAIN data, generate DDL or DB2 utility JCL, edit DB2 table spaces, perform security administration, and much more. MAINVIEW for DB2 contains numerous hyperlinks to RxD2.
- The *MAINVIEW for DB2 Customization Guide* provides product-specific tailoring instructions. Use this book in conjunction with the *MAINVIEW Installation Requirements Guide* and the *MAINVIEW Common Customization Guide* during the customization process.
- Online tutorials are available by selecting option T from the MAINVIEW for DB2 Primary Option Menu or by pressing HELP (PF1/13) from the product application panels.

---

## Chapter 1. Introduction

MAINVIEW for DB2 provides powerful realtime application performance analysis and monitoring for effective DB2 subsystem management. It comprises an easy-to-use, comprehensive set of services for database administrators, applications developers, and system programmers to track DB2 activity and status. Users can easily access any number of DB2 subsystems on multiple MVS systems in local and remote locations from a single terminal session, which can run under TSO, TSO/ISPF, VTAM or batch with an EXCP-supported terminal. It provides

- Online performance analysis and exception monitoring
- DB2 application tuning and workload analysis
- Historical reporting
- DB2 operations control
- MAINVIEW product integration

---

### DB2 Online Performance Analysis

DB2 online performance analysis includes

- Current status and activity
- Exception monitoring
- DB2 Tuning Wizards
- Complete system management
- DB2 catalog and table access

### Current Status and Activity

MAINVIEW for DB2 provides displays of DB2 status, current thread status—both summary and detail, locking, EDM and buffer pools, table spaces, I/O activity, logging, and DSNZPARM data necessary to analyze system performance and bottlenecks. This information is always available at very low overhead cost even when DB2 processing suspends.

These displays are easily accessible through both windows mode and full-screen mode applications. Hyperlinks and an EXPAND function allow the user to move quickly from summary to detail information. Windows mode technology provides context-sensitive help with extensive DB2 tuning information. In addition, screen customization, graphics, and multiple windows provide the flexibility for each user to present the data exactly as needed to solve any monitoring or analysis task.

### Exception Monitoring

Key values can be set up for continuous background monitoring and exception reporting based on user-defined thresholds. The history of the monitored values, such as buffer pool utilization or number of transactions processed per workload, is available online in historical plots. Special exceptions can be defined to detect applications using excessive resources (runaway queries), with different user-defined exception criteria for TSO, IMS, CICS, DBATs, or batch jobs. The available options are described in the *MAINVIEW for DB2 Customization Guide*. Global exception displays show current status and a history of exception messages is available in the chronological Journal log.

## DB2 Tuning Wizards

DB2 Tuning Wizards are designed to help you cope with today's complex systems and time pressures, turning data overload into usable knowledge about your DB2 systems. Wizards take advantage of the power of windows mode without requiring that you be an expert in all its usage techniques.

Each wizard is a set of views that leads you through all of the related information about a specific area of DB2 performance, providing critical DB2 tuning help and recommendations at just the point where they are needed. It presents the critical data in context with quick access to further details if needed.

Dynamic decision panels provide a consistent approach. Questions show the diagnostic paths, identifying *what* each path shows and *why* they could be important. Key indicators on the decision panels show whether a path is worth following, based on relevant current and long-term measurements.

## Complete System Management

MAINVIEW for DB2 reports on key information from MVS, IMS, and CICS to assist in understanding the total DB2 environment. It is also part of a family of integrated products for performance monitoring and automated operations of DB2, IMS, CICS, MQSeries, and MVS.

## DB2 Catalog and Table Access

MAINVIEW for DB2 is also integrated with RxD2/FlexTools, a comprehensive set of flexible DB2 tools that provides complete DB2 catalog management, security administration, extensive EXPLAIN and SQL test facilities, and DB2 object maintenance. These functions can be invoked directly from MAINVIEW for DB2. RxD2/LINK, the base architecture of the product, provides a standard interface to DB2 from IBM's SAA REXX language.

---

## DB2 Application and Workload Analysis

MAINVIEW for DB2 provides both application and workload analysis.

### Application Trace

The major concern in most DB2 installations is how to understand and control application and ad-hoc query SQL performance. MAINVIEW for DB2 addresses these concerns with a flexible application trace facility that can be used both by DBAs and application developers. The application trace facility provides all the data necessary to detect and solve SQL problems and review applications before production migration. Trace requests are managed automatically through DB2's Instrumentation Facility Interface (IFI).

Each trace request can be tailored to collect only the data required, from low-overhead summary traces (DB2 accounting records) through detail traces of SQL statements plus scans, I/Os, DDF events, and locks.

The traced data is viewed in integrated displays so that it is easy to see which scans, sorts, or I/Os are caused by which SQL statements without manual correlation. Summary displays provide high-level quick answers such as which SQL statement is consuming the most elapsed or CPU time. A chronological event trace shows a replay of the exact sequence of traced events. Details can be hidden to improve understanding of event flow or revealed when needed for detailed analysis.

Trace requests can be focused to narrow trace data collection by selecting specific workloads by such criteria as plan or authorization ID. Additional exception filters, such as *elapsed time greater than 10 seconds*, also can be defined so that only trace data that needs to be analyzed is retained.

### Workload Analysis

Workload analysis can be automated with low-overhead workload monitors and traces. Proactive monitoring reduces the effort required to stay on top of how DB2 is performing and collects the historical data you need online. Workload monitors set up by workload group can detect service-level exceptions. Summary traces with different exception filters for CICS, IMS, TSO, and batch can save key data needed for later analysis of problem transactions or queries.

In windows mode, you can define workload groups and track service-level objectives based on thread elapsed or in-DB2 elapsed time. Default workloads are defined for transaction and query workloads based on DB2 attach type. You can further refine these workloads into application groups using DB2 identifiers such as plan name or connection.

---

## Historical Analysis

Historical data can be tracked with trace logs, online views, and offline batch reports from DB2 tables.

## Trace Logs

The trace logging facility allows logging of both summary and detail trace data to external VSAM data sets. All trace log data sets are tracked in an online trace directory. These data sets can be viewed online or printed in batch for offline review.

## Online Views

A historical perspective on the data in online windows mode views is shown in two ways. First, when data is collected for a query to present a view, the data often covers both current interval and session data since DB2 started. Second, windows mode supports historical logging of data each interval. Interval records are written to the online historical data sets to capture the status of the monitored targets each time an interval completes. This data can be retrieved in the same views generally used for current-time data. This includes complete DB2 statistics data, I/O and lockout information, and the data collected by monitors.

## DB2 Tables

Complete batch reporting on the DB2 statistics and accounting records is supported by creating DB2 tables. Each table can be tailored to contain only the columns you need. The detail accounting records can be summarized before loading into DB2. MAINVIEW for DB2 provides predefined batch and QMF reports, and the full power of SQL, QMF, and GDDM is available for user-defined reporting. The accounting data tables can be summarized into daily, weekly, or monthly tables to support long-term reporting without excessive DASD usage. Both summarization and purge routines are provided. Detail tables and reports are provided for audit data.

---

## Operations Control/DB2 Console

MAINVIEW for DB2 provides several unique features that aid in operations control of DB2:

- DB2 console. A chronological journal log (LOG DISPLAY) of DB2 messages and MVDB2 exceptions allows you to go back in time to analyze earlier problems. From this log, DB2 commands can be issued and the responses viewed. The *MAINVIEW for DB2 Customization Guide* describes how to activate the logging of DB2 messages and the authorization required for a user to issue DB2 commands.
- Multiple systems support not only provides immediate user access to multiple DB2 systems on the same CPU but also to any number of DB2s on multiple MVS systems in local and remote locations.

The windows mode technology also enables Single System Image (SSI) views that can pull together and even summarize data from multiple DB2 subsystems.

This capability increases the span of control and saves time for all users managing more than one DB2. For example, a status overview display presents key indicators and exceptions for all DB2s, allowing for a quick check for potential problems. Any set of related DB2s, such as production or test, can be defined as a context for SSI monitoring.

SSI views are even more important in a data sharing environment, since now a group of DB2 members that work together can finally be monitored as a whole. This not only simplifies sysplex management, but also increases understanding of this complex environment.

- Cycle screen refresh through full-screen status and exception displays from all these DB2 systems provides dynamic monitoring of multiple DB2s.
- Seamless integration with the BMC Software AutoOPERATOR products automates both DB2 operation and performance monitoring. Messages can initiate rules to take action, query the MVDB2 analyzer displays for additional information, or issue monitor commands. Exception messages can be sent to the MVS console to interface with other automated operator products.
- Total system status of all monitored values versus site thresholds can be seen at a glance in a graphic display with color support. Potential problems that have not yet resulted in exception conditions can thus be easily detected.
- User access through EXCP assures access even when TSO or VTAM does not respond.
- Security is provided per function and per DB2 system through user profiles and a user exit that controls access to thread activity displays.

# MAINVIEW Product Integration

The MAINVIEW architecture integrates all the MAINVIEW performance products within a common communications framework that operates across multiple machines in multiple locations as shown in Figure 2. This integrated architecture allows a single terminal session using one or more MAINVIEW products to monitor and manage multiple local or remote targets, whether MVS itself (sysplex and non-sysplex) or subsystems like CICS, IMS, MQSeries, and DB2.

MAINVIEW for DB2 runs in the same architecture as the other MAINVIEW products. You can access all installed products from the MAINVIEW Selection Menu in one terminal session and quickly transfer directly from one product to another. See *Using MAINVIEW* for further information.

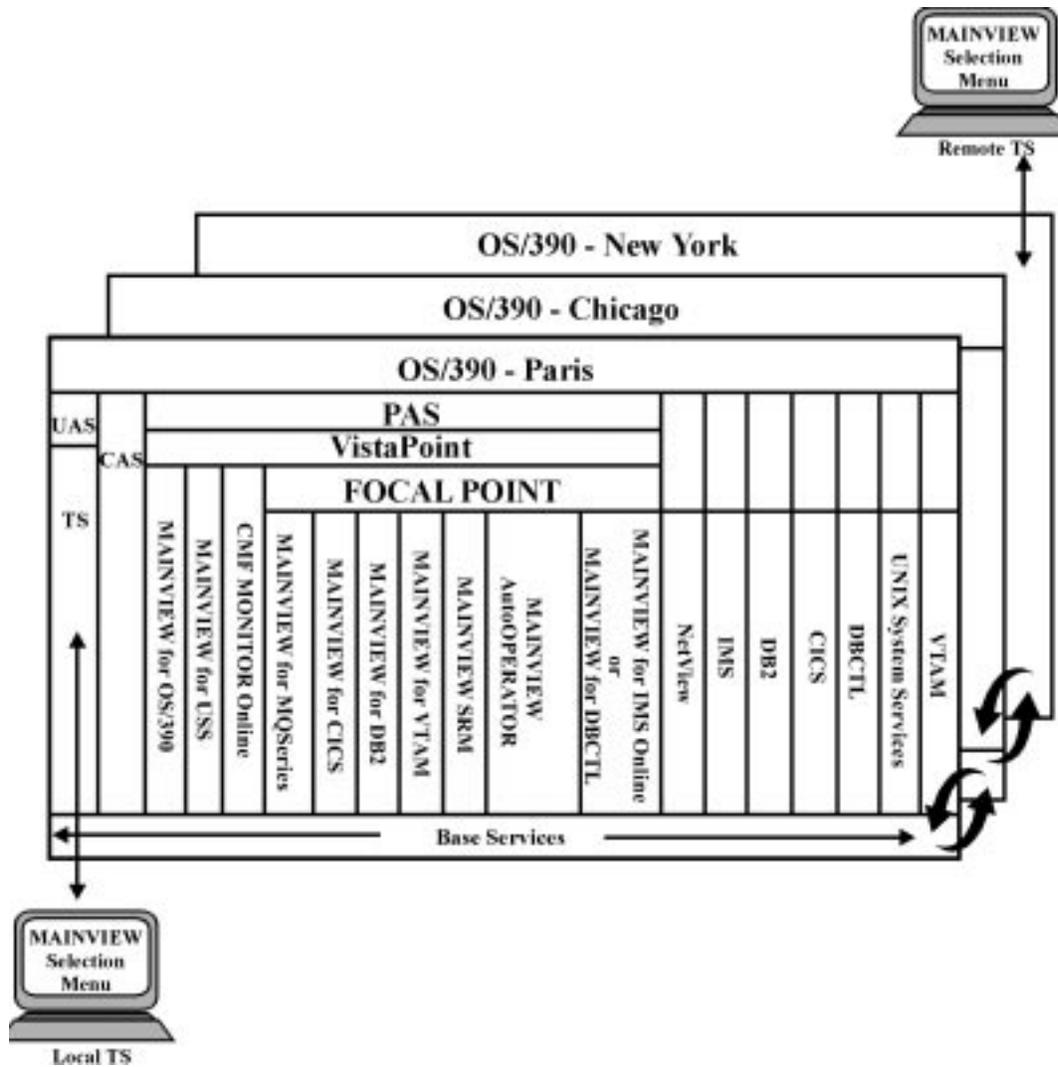

Figure 2. MAINVIEW Architecture

The elements of this architecture include

**UAS** User Address Space

Address space where a terminal session (TS) executes. A TS accesses MAINVIEW views and services. A TS can start in an address space locally where products are running or remotely in an address space on another system.

**CAS** Coordinating Address Space

Manage communication with other local and remote CASs and enables direct communication between a TS and a PAS.

**PAS** Product Address Space

Contains data collectors and runs MAINVIEW products as follows:

MVS PAS	CMF MONITOR MAINVIEW for OS/390 MAINVIEW for UNIX System Services MAINVIEW VistaPoint for MVS workloads
BBI-SS PAS	MAINVIEW AutoOPERATOR MAINVIEW for CICS MAINVIEW for DB2 MAINVIEW for DBCTL MAINVIEW for IMS MAINVIEW for MQSeries MAINVIEW for VTAM MAINVIEW for WebSphere MAINVIEW VistaPoint for CICS, DB2, and IMS workloads
MVALARM PAS	MAINVIEW Alarm Manager
Storage PAS	MAINVIEW Storage Resource Manager (SRM)

**Base Services** BMC Software Base Technology

---

## Chapter 2. Signing On to MAINVIEW for DB2

Follow these steps to access MAINVIEW for DB2:

1. If your ISPF main menu contains an option for MAINVIEW products, select that option.<sup>1</sup>

Alternatively, on the **COMMAND** line of any ISPF panel, type **TSO MAINVIEW**. (MAINVIEW is a CLIST that you or your product administrator created during MAINVIEW for DB2 AutoCustomization.)

The MAINVIEW Selection Menu is displayed, as shown in [Figure 3](#).

```
----- MainView Selection Menu -----
OPTION  ==>>                                DATE  -- 01/03/14
                                           TIME  -- 08:36:58
0 Parameters      Specify MainView options   USERID -- JSMITH2
1 PLEXMGR         MainView Plex administration  MODE  -- ISPF 5.0
2 FOCAL POINT    Subsystem monitoring and alerts
3 AutoOPERATOR   Automation and resource control
A MVALARM        MainView Alarm management
T InTune         Program analysis and tuning
V VistaPoint     Comprehensive view of applications and resources

MainView for
4 CICS           CICS performance and control
5 DB2            DB2 performance and control
6 IMS           IMS performance and control
7 MVS           MVS performance and control
8 MQSeries      MQSeries performance and control
9 USS           UNIX System Services performance and control
10 VTAM         VTAM Network performance and optimization

```

Figure 3. MAINVIEW Selection Menu

2. You can enter any installed MAINVIEW product from this menu. To access MAINVIEW for DB2, select option **5, DB2**.

The Parameter Confirmation panel appears, as shown in [Figure 4 on page 12](#).

---

<sup>1</sup> If you are using MAINVIEW Alternate Access, see the *MAINVIEW Alternate Access Implementation and User's Guide* for information on accessing the MAINVIEW Selection Menu.

---

```

BMC Software ----- Parameter Confirmation ----- MainView for DB2
Command ==>

Confirm parameters for this session of MainView for DB2:

Context ==> ALL           Default context

Screen  ==> MVDB2        Initial screen

Mode    ==> WINDOW       Window/Full/FullScreen (Initial Mode)

Confirm ==> YES          Yes/No (Show this panel at next session startup)

Press Enter to continue or press HELP for additional information.

```

Figure 4. MAINVIEW for DB2 Parameter Confirmation Panel

This panel prompts you to confirm the parameters for your MAINVIEW for DB2 session. The first time you sign on, the default parameters are

- a context of all active DB2 subsystems
- an initial screen of MVDB2, which displays an Easy Menu called EZDSSI
- a primary display mode of MAINVIEW windows mode

You can change the parameters for a session by changing the values on this confirmation panel. You can also change the default parameters for future sessions of MAINVIEW for DB2 by using option 0.1, Parameters–Windows Mode, of the MAINVIEW Selection Menu.

3. Press **Enter** to accept the default session parameters.

The EZDSSI view appears, as shown in [Figure 5](#).

```

> Page Set Menu                          .                 . Return...

```

Figure 5. EZDSSI Easy Menu—Monitor Multiple DB2s

**Note:** Depending on your MAINVIEW settings, you may see the Session Control Parameters panel first. This panel prompts you to specify (or confirm) the CAS subsystem ID to be used for this MAINVIEW session. If you are not sure what CAS ID to use, check with your system administrator.

Some MAINVIEW for DB2 online services operate in windows mode, while others operate in full-screen mode. The EZDSSI view is a good starting point for working in windows mode. It provides direct access to context-oriented services for groups of DB2 subsystems.

However, if you expect to make more use of the full-screen services for a single DB2 target, you should specify **FULLSCREEN** in the **Mode** field of the Parameter Confirmation panel. In that case, the MAINVIEW for DB2 Primary Option Menu, shown in Figure 6, is displayed when you sign on, rather than the EZDSSI view.

```

BMC Software ----- PRIMARY OPTION MENU ----- MAINVIEW FOR DB2 7.1.0
OPTION ==>>>                                     DATE -- 01/03/22
                                                    TIME -- 13:45:08
                                                    USERID -- CIR11
                                                    MODE -- ISPF 4.2

## Chapter 3. Introduction to Views and Wizards

MAINVIEW for DB2 views exploit MAINVIEW windows-mode technology to display extensive DB2 data covering the analysis of

- DB2 subsystems
- Buffer pools and group buffer pools
- Page set status and I/O
- Lock contention lockout events
- Current thread activity
- ZPARMs
- Dynamic SQL cache

All of this data, except for the last three groups, is available not only for the current time period, but also with online history.

Context-sensitive help includes extensive DB2 tuning information, while screen customization, graphics, and multiple windows provide the flexibility for each user to present the data exactly as needed to solve any monitoring or analysis task.

The windows-mode technology also enables single system image (SSI) views that can pull together and even summarize data from multiple DB2 subsystems.

This capability increases the span of control and saves time for all users managing more than one DB2. For example, a status overview display presents key indicators and exceptions for all DB2s, allowing for a quick check for potential problems. Any set of related DB2s, such as production or test, can be defined as a context for SSI monitoring.

SSI views are even more important in a data sharing environment, since now a group of DB2 members that work together can finally be monitored as a whole. This not only simplifies sysplex management, but also increases understanding of this complex environment.

**Note:** The analyzer, monitor, and trace displays of MAINVIEW for DB2 are described in the other volumes of the *MAINVIEW for DB2 User Guide*. These services are referred to collectively as running in full-screen mode.

---

## Chapter 4. Getting Started with Windows Mode

This chapter provides a short overview of windows mode from a DB2 point of view.

If you are new to windows mode, a short introduction is available in *Quick Start with MAINVIEW*, which you should read before using windows mode for the first time. More complete information is provided in *Using MAINVIEW*.

---

### Accessing Windows Mode

The views in windows mode can be accessed in two ways:

- From the MAINVIEW Selection Menu, select Option 5 and then select windows mode directly (mode WINDOW). Or, select Option V from the MAINVIEW for DB2 Primary Option Menu (FULLSCREEN mode). This presents a menu of options to monitor all DB2s.
- From the MAINVIEW Selection Menu, select Option 1, Plex Manager, to access lists of available targets and products. In a view showing targets, like PLEXOVER, cursor select (in the Context or Product field) a DB2 subsystem target where the product is shown as MVDB2 to access a menu of options to monitor one DB2 at a time.

Examples of these menus are shown in [Figure 7 on page 21](#) and [Figure 8 on page 22](#).

### Accessing Views

Windows-mode data is displayed in *views*. A view is a display of information within a single window. There are four view types: tabular, summary (tabular), detail, and detail summary.

**Note:** Summary views combine data records by one or more keys. These views are generally suffixed with a Z.

The simplest way to move between views is to *hyperlink* to another view. You can do this by cursor selecting either a menu option or a highlighted field. (This is similar to *Expand* in full-screen mode.)

You can access views by one of the following methods:

- Hyperlink from a menu option.
- Hyperlink from a highlighted field in another view.
- Type the name of the view on the COMMAND line.
- Select the name of a view from a list of views:
  - The MAIN view presents a list of submenus with lists of related views that can be selected.

**Note:** You can access MAIN by using the S line command in the PLEXOVER view. Also, if you get lost, you can always type MAIN to get this list of views for any windows-mode product.

- The VIEWS view presents a list of all distributed or site views.
- The USERS view (available from MAIN) presents a list of all views that you have customized.

## Easy Menus

All windows-mode products have *Easy Menus* to make it easier to access the information you need. All DB2 Easy Menus begin with EZD.

### EZDSSI—Monitor Multiple DB2s

The EZDSSI view, shown in [Figure 7](#), is one of the two primary product menus. It is designed for use when you want an overview of several target DB2 subsystems together in SSI mode.

```

W1 =EZDSSI===== (ALL=====*) 17MAR2001==14: 49: 11====MVDB2====D====1
                                DB2 SSI Easy Menu

      Status
      . Overview
      . Exceptions
      > Buffer Pools
      > Status Menu

      Data Sharing
      . GBP Group Status
      . GBP Group Activity
      . Global Lock Stats
      . Global Lockouts
      . Volume I/Os (SSI)
      > Page Set Menu

                                Monitors
      . In Warning
      . Summary By Area
      . Active
      . Workload Objectives

                                Tools And Menus
      . Set SSI Context
      > Easy Menu
      > MAIN Menu
      > Tuning Wizards
      . Return...

      Threads
      . Current Threads
      . DB2 Summary
      . Attach Summary
      . Connect Summary
      . Plan Summary
  
```

Figure 7. EZDSSI Easy Menu—Monitor Multiple DB2s

You can access this menu by entering windows mode through a menu option, as described on [page 19](#), or type its name, EZDSSI, on the COMMAND line. In this case, be sure to set the context to a valid SSI context. You see the current context in the window information line.

The SSI context of ALL is always available and is the one set by default through the V option. There may be other SSI contexts already defined that group several DB2s together, such as PROD or TEST, or a data sharing group. Select the Set SSI Context option to view a list of defined contexts. Hyperlink on any context to return to EZDSSI with that context set. If you already know the SSI context name, type

```
CON ssi context
```

on the COMMAND line.

See [Chapter 8, “Using SSI Contexts” on page 39](#) for more information. The window menu options present EZDSSI, context ALL, by invoking a screen definition named MVDB2. To modify the default context, add additional views to this screen, or create new screens, type HELP SCREEN, or see the *Using MAINVIEW* book.

## EZDB2—Monitor One DB2

EZDB2, shown in [Figure 8](#), is the second of the two primary product menus. It is designed for use when you want to focus on information about one target DB2 subsystem.

```

W1 =EZDB2===== (ALL=====*) 17MAR2001==17: 36: 11====MVDB2====D====1
                                DB2 Easy Menu
      DB2 Target --->
      Status
      . Overview
      . Exceptions
      . Buffer Pools
      . DDF Connections
      . Activity Rates
      > Status Menu

      Lockouts
      . Events
      . Resource Summary
      . Connection Summary
      . Blocker/Waiter Summary
      . Page Sets
      . Page Set Status
      . Volume I/O Summary
      > Page Set Menu

      Monitors

      Tools And Menus
      . Set Target Context
      . DB2 Catalog/Explai n
      > SSI Easy Menu
      > DBA Easy Menu
      > Fast Menu
      > MAIN Menu
      > Tuning Wizards
      . Return...
  
```

Figure 8. EZDB2 Easy Menu—Monitor One DB2

You can access this menu by one of these methods:

- Select a target DB2 (with product MVDB2) from Plex Manager, as described on page 19.
- Select EZDB2 from the EZDSSI menu.
- Type the menu name, EZDB2, on the COMMAND line.

In the last two cases, be sure to set the context to the name of the DB2 you want to monitor. Select the Set Target Context option to view a list of defined targets. Hyperlink on any target to return to EZDB2 with that context set. If you already know the target name, type

```
CON db2target
```

on the COMMAND line.

## EZDBA—Applications Menu

There is an alternative Easy Menu view, EZDBA, shown in [Figure 9](#), that is oriented more toward applications analysis in one DB2.

```

W1 =EZDBA=====DB2H=====*=====17MAR2001==13: 04: 37====MVDB2====D====1
                                DB2 DBA Easy Menu

Current Status                                Current Thread Activity
. Overview                                +-----+ . Active Threads
. Exceptions                                | Place cursor on | . CICS Connect Summary
. User Lock Contention                    | menu item and   | . Attach Summary
. Page Set Status                          | press ENTER    | . Connect Summary
> Status Menu                              +-----+ . Plan Summary

System Analysis                               Workload Analysis           Tools and Menus
. Buffer Pools                               . Thread History           . Set Target Context
. Dynamic SQL Cache                         . Workload Objectives
> ZPARM Menu                                . Current Traces           > Easy Menu
. Lockout Events                             . History Traces           > SSI Easy Menu
> Lock Wizard                               . Start Trace              > Fast Menu
. Volume I/O Activity                       > DB2 Catalog/Expl ain    . Return...
> Page Set Menu

```

Figure 9. EZDBA Easy Menu—Applications Menu

You can access it from EZDB2, or it can be incorporated in a screen definition and specified as the default screen when entering windows mode.

## Other DB2 Easy Menus

Some of the options on EZDB2 and EZDSSI are shown with a greater sign (>) in front of them instead of a period (.), indicating that this hyperlink goes to another menu. For example, the status and statistics information available is so large that it is most easily accessed through another Easy Menu, EZDSTAT. Therefore, the main menus offer direct access to some of the most frequently used status views, plus access to the Status Menu.

MAINVIEW for DB2 also has a Fast Menu, EZDFAST, that provides quick access to most full-screen displays from one spot in windows mode.

---

# Integrating Views with Other MVDB2 Services

The following MAINVIEW for DB2 functions enable you to easily use the windows mode views along with the other full-screen MVDB2 services.

## Hyperlinks

There are many hyperlinks from windows mode to full-screen displays of DB2 data that are more detailed than the data currently available in windows mode. PF3 returns you directly to your position in the windows mode view. For example, current thread activity is available in windows mode, but to see all the 200+ accounting fields for one specific user, a hyperlink goes to the full-screen DUSER display.

Hyperlinks from full-screen displays to windows-mode views are not provided.

## Transfers

You can transfer directly from windows mode to full-screen mode by typing a transfer command on the COMMAND line of a view. To transfer to a DB2 display, type

```
TRANsfer target DB2; serv
```

A few examples are

```
TRAN DB2G DB2; LOG          to access the Journal Log display for DB2G
TRAN DB2P DB2; EX DB2ST DELTA to see delta values in DB2ST for DB2P
TRAN DB2P DB2; RX           to access RxD2 for DB2P
```

To transfer from full-screen mode to windows mode, use

```
TRANsfer target MVDB2; vi ew
```

## Return

If you entered windows mode with the V option, pressing PF3 repeatedly or typing QUIT or RETURN returns you to the DB2 Primary Option Menu. From here, you can access all the full-screen displays as usual. If you entered windows mode through Plex Manager, pressing PF3 repeatedly or typing QUIT or RETURN returns you to the MAINVIEW Selection Menu. You can then choose Option 5, DB2, to access the full-screen displays.

## Monitor Data

All the data collected by the DB2 monitors is available in both windows-mode views and full-screen displays. Use the windows-mode views when you need an SSI overview or want to use the additional customization options.

---

## Integrating Views with Other MAINVIEW Products

If other MAINVIEW products are installed, they are available from the MAINVIEW Selection Menu or Plex Manager. In Plex Manager, you see a list of all targets and the products monitoring them.

### Screens with Multiple Products

You can define screens (multiple windows with different views) that include views from different products when you want to look at related data across targets. For example, you may want to look at CICS systems that are accessing DB2 on the same screen with one of the MVDB2 current thread activity views.

Product transfers to full-screen mode. You can transfer to another product running in full-screen mode with the same command shown above for DB2:

```
TRANsfer target product; serv
```

In this case, replace the product variable with the product family name (AO, CAO, CICS, DB2, IAO, IMS, MAO).

### Product Transfers to Windows Mode

From within windows mode, you can transfer to another product running in windows mode with the SET or CONTEXT command. SET presents a panel where you fill in the target, product, and view name. If you prefer, you can type this directly on the COMMAND line:

```
CONtext target product; vi ew
```

In this case, use the product name shown in windows-mode views (CMF, MVCICS, MVDB2, MVIMS, MVMVS, PLEXMGR).

To transfer from full-screen mode to windows mode, type

```
TRANsfer target product; vi ew
```

with the product names shown above.

### VistaPoint Workloads

If VistaPoint is installed, you can combine DB2 workload data with workloads from other products under common application names. See [Part 3, “Managing Views” on page 31](#).

## Chapter 5. Using the DB2 Tuning Wizards

This chapter discusses how to use the DB2 tuning wizards.

DB2 tuning wizards are designed to help you cope with today's complex systems and time pressures, turning data overload into usable knowledge about your DB2 systems. Wizards take advantage of the power of windows mode without requiring that you be an expert in all its usage techniques.

Each wizard is a set of views that lead you through all of the related information about a specific area of DB2 performance, providing critical DB2 tuning help and recommendations at just the point where they are needed. It presents the critical data in context with quick access to further details if needed.

Dynamic decision panels provide a consistent approach. Questions show the diagnostic paths, identifying *what* each path shows and *why* they could be important. Key indicators on the decision panels show whether a path is worth following, based on relevant current and long-term measurements.

Key indicators on the decision panels are the sign posts to help you decide which paths to follow to identify and solve problems. The measurements have defined thresholds that highlight problems as appropriate. View customization allows each user to modify these thresholds as needed. Often, you can immediately determine whether a path is worth following, avoiding false trails and time-consuming analysis.

Figure 10 shows an example of a decision panel. It is the start point of the Lock Analysis Wizard.

```

All OK? Congratulations!
(PF3 to Exit Wizard)

```

Figure 10. WZLOCK View—Lock Analysis Wizard

You can use a tuning wizard anytime without a long learning (or relearning) curve. Help is available on each of the decision points, in addition to the standard field help. These help panels include navigation tips as well as DB2 tuning information.

## Tuning Wizards

**Note:** No further written documentation should be needed. If you have suggestions for improvements, please send them in!

The list of wizards is expected to expand over time. The tuning wizards are accessed from the DB2 Tuning Wizard Menu, as shown in [Figure 11](#). New wizards are added here as they are developed.

---

## Chapter 6. Viewing DB2 Performance Over Different Time Periods

This chapter presents how DB2 performance data can be viewed over different time periods.

There are two different ways that a historical perspective on the data is shown. First, when data is collected for a query to present a view, the data often covers more than just one time period. Second, windows mode supports historical logging of data for each interval. This data can be retrieved in the same views generally used for current-time data.

---

### Data Collection Periods

Most DB2 windows-mode statistics are available as *interval* and *session* counts, except for current thread information, which is measured for the life of the thread to the time of the query.

**Interval** data represents the near-term performance of your DB2 targets. Typically, the interval is defined as 15 minutes. When you issue a view query for interval data, MAINVIEW for DB2 displays data for the current interval, which means that you see data from the beginning of this interval until the query was issued. The data collected represents that portion of the interval that has elapsed, something between 1 to 15 minutes. This is similar to the DELTA concept in the MAINVIEW for DB2 full-screen displays.

**Session** data represents a summary of performance information since the monitored DB2 system(s) started.

There are naming conventions for views to differentiate between these two types of data. If the data shown is interval data, there is no special suffix, while session data views are suffixed with an S. For example, total I/O counts per page set are shown for the interval in view PSTIO, while session counts are shown in PSTIOS.

Many detail DB2 statistics views show both interval and session counts together.

The monitor data available in windows mode is more granular, and includes **realtime** values for the most recent period, typically the last 60 to 90 seconds. This provides a much better indication of current problems. Realtime views are suffixed with an R.

In addition, some monitor views contain all three time periods in one view. These **cluster** views provide a better perspective of how these indicators have behaved over time. Cluster views are suffixed with a C.

---

### Historical Data

Statistics data is available both for the current time period and from online historical data sets. Interval records are written to these data sets to capture the status of the monitored targets each time an interval is completed.

You can retrieve these interval records by date, time, and duration with the `TIME` command to analyze past problems or performance concerns. In this case, the interval counts are generally for a full past interval. The actual duration of the time span that the retrieved data covers is shown on the view in the window information line.

The `DSL` view in Plex Manager shows which history data sets are available and the time periods covered.

---

## Part 3. Managing Views

This part describes system administration and operations views that are specific to MAINVIEW for DB2.

## Chapter 7. Defining a DB2 Workload

This chapter discusses how to define a DB2 workload.

A workload groups DB2 threads for performance reporting and analysis. You build a DB2 workload using a workload definition dialog called DWKLDDEF, which allows you to

- Establish a service-level objective for expected workload performance
  - Performance is measured by the service-level objective set for a workload. The service-level objective comprises
    - Response time limit set as a maximum threshold for acceptable performance
    - Percentage of transaction completions within the specified response time limit
- Assign a composite name to that workload grouping

Your defined service-level objectives and composite workloads are reported by MAINVIEW VistaPoint. MAINVIEW for DB2 also reports your defined workloads in response time views.

---

### Planning a DB2 Workload Definition

To create a DB2 workload:

1. Access the DWKLDDEF dialog.
2. Start an edit session.
3. Save the workload definition.
4. Install the definition.

Before you begin, you need to establish workload conventions, identify critical monitoring periods, and set a workload service-level objective. A service-level objective is the minimum acceptable performance of a workload based on a user-specified transaction completion time and expected transaction completion percentage.

### Default Workloads

Default workloads have been defined for the transaction and query connections to DB2, based on connection type. This includes

- IMSMPP
- CICS
- TSO
- CAF
- DBATDB2
- DBATDRDA

Batch-type work is not included in the default set.

Please review the values specified as response time objectives, objective percents, and start and end times. They are only meant as a starting point.

The DOBJx views show the results of the data gathered using these definitions. You may want to review them for a while to see how effective these objectives are in your environment. Then you can use this information in planning your changes. You can modify, delete, or add workloads.

## Establishing Workload Conventions

Workload definitions are created in edit mode. When they are saved, they are saved in BBPARM member BBPTWK00 by default. These members can be in a shared library. If they are not in a shared library, you should have a consistent naming convention for similar workload members in different BBPARM data sets.

### Shared BBPARM Library

Your BBPARM library should be accessible to all PASs. This keeps the number of workload definitions to a minimum. Otherwise, duplicate workload definitions must be created for each linked PAS to ensure that performance data from all targets is reported. Maintenance is easier if updates are made to a single workload definition rather than simultaneous changes to similar definitions in different parameter libraries.

### Naming Conventions

Consistent names for workloads are important when

- Workload definitions cannot be stored in a shared BBPARM library

Similar workloads in different BBPARM libraries must be easily identifiable for workload definition updates.

- Sorting and filtering by workload or composite name is available in other views

Sorting and filtering are much easier with consistent names.

Workload names should be a brief representation of the work performed by the target. For example, DB2PAY1A identifies DB2 payroll transactions running in the DB21A subsystem. It can be a maximum of eight characters.

Composite names identify the workload grouping by the group's function. For example, a workload composite with a name of FINANCE indicates a workload's targets are completing financial transactions. Composite names can be a maximum of eight characters.

## Identifying Critical Workload Monitoring Periods

During the day, there are periods when transaction performance is not at risk because of the relatively light load on the system. Other daily periods are critical. The demands on system resources lead to contention and transaction delays. You should monitor all your workloads during your site's daily periods when adequate transaction performance is essential. Workloads belonging to the same composite workload should have identical monitoring periods.

## DWKLDDEF—DB2 Workload Definition

The DWKLDDEF view, shown in [Figure 12](#), is the starting point for defining a DB2 workload.

```

>W1 =DWKLDDEF=====DB2G54C==*===== (00 BROWSE )====MVDB2====D====7
CMD Workload Composite Target System Description Sta Resp %Tr
--- Name---- Name----- Target System Description Sta Resp %Tr
ALLWORK SAMPLE * * Sample DB2 Workload Act 1.00 95
CAF DB2SAMP * * CAF DB2 Workload Act 5.00 90
CICS DB2SAMP * * CICS DB2 Workload Act 1.00 95
DBATDB2 DB2SAMP * * DBAT DB2 Workload Act 5.00 90
DBATDRDA DB2SAMP * * DBAT DRDA Workload Act 5.00 90
IMSMPP DB2SAMP * * IMS MPP DB2 Workload Act 1.00 95
TSO DB2SAMP * * TSO DB2 Workload Act 5.00 90

```

Figure 12. DWKLDDEF View—DB2 Workload Definition

You can select the DWKLDDEF view at any time by typing one of the following view names on the COMMAND line:

- **DWKLDDEF**

Provides direct access to a list of existing DB2 workload definitions.

- **ADMIN**

Groups views by system and operations administration functions and is available from the MAIN menu when MAINVIEW for DB2 starts. Select DWKLDDEF from the list of ADMIN views.

- **IEWS**

Provides an alphabetical list of all views. Select DWKLDDEF from the list of views.

To add a new or change an existing DB2 workload definition, you must first type EDIT on the COMMAND line of the DWKLDDEF view.

The window information line changes from BROWSE to EDIT. In edit mode, you can use

- Primary commands to

- ADD a new definition
- CANCEL any changes made  
This discards any changes made to the definition since the last save.
- SAVE a definition you have added or changed
- END your edit session  
This saves any changes you made and returns the previous view.

- Line commands to select an existing definition to

- ADD a definition using one you selected as a model
- CHAnge the selected definition
- DELete the selected definition
- UNDelete or recover the selected definition if it is not saved
- INStall or activate the selected definition

### Using the DB2 Workload Definition Dialog

Online help describes how to use the fields in the dialog. Press your HELP key for descriptions of the fields by

- Workload  
Name of the workload.
- Composite  
Name used to group workloads together.
- Target  
Name of the DB2 target to be monitored.
- System  
Name of the MVS image where the target DB2 is running.
- Description  
Describes (maximum of 24 characters) what this workload definition is for.
- Monitored Resources  
For DB2, these are
  - Connection Type
  - Plan Name
  - Authorization ID
  - Connection Name
  - Correlation ID
  - Location Name
- Service-Level Objective  
This comprises user-specified
  - Response time in seconds; for example:  
Response time of ==> 1.0
  - Percentage of transactions to complete within specified response time; for example:  
for ==> 95
  - Start time monitoring is to begin; for example:  
Between ==> 00:00
  - End time when collection of response or elapse time data is to stop; for example:  
and ==> 24:00
- DB2 Only  
Specifies whether total elapsed time should be used instead of In-DB2 elapsed time (In-DB2 times require accounting class 2 to be active). If yes is specified, In-DB2 elapsed time is used. If no is specified, total elapsed time (since the first connection of the thread to DB2) is collected.

## Saving and Installing the DB2 Workload Definition

After you have completed the DB2 workload definition dialog, you must save your definition and install it before it becomes active. Typing `SAVE` on the `COMMAND` line saves the workload definition you modified or added and retains edit mode for more changes. Pressing your `END` key saves your definition and returns the previous view.

Typing the `INStall` line command next to the listed workload definition starts monitoring of transaction response time if you are within the defined time range. The `DWKLDDDEF` status field changes from inactive to active.

If you updated an existing workload definition with the `CHAnge` line command and saved it, the `INStall` command deactivates the current definition. Monitoring begins with the parameters set in the updated workload definition.

`INStall` immediately updates the local `BBI-SS PAS`. If you are running `MAINVIEW` for DB2 in multiple `PASs`, you may want to issue the `INStall` on any additional `PASs` now. Otherwise, any `SAVED` definitions become active when those `PASs` are recycled.

## DWKLDDDET—DB2 Workload Definition Detail

The DWKLDDDET view, shown in [Figure 13](#), provides detailed information about the status and parameters in effect for a definition selected from the DWKLDDEF view. It shows the current values of the parameters.

```

>W1 =DWKLDDEF=DWKLDDDET=DB2G54C==*===== (00 BROWSE          )====MVDB2====D====1
Workload. CICS      Description CICS DB2 Workload
Composite DB2SAMP  ConnType... CICS
Target... *        PlanName...
System... *        AuthID....
Response. 1.00     ConnName...
%Trans... 95      CorrID....
Start.... 06:00   LocName...
End..... 06:00
DB2 Only. Y
Deleted.. N
Status... Active

```

Figure 13. DWKLDDDET View—DB2 Workload Definition Detail

The values shown may not be in effect if the parameters have changed and

- Changes were activated with the INStall command, but not SAVED  
The status of the definition is Install. The installed parameters are in effect.
- The changed parameters were SAVED, but not INStalled  
The status of the definition is Modified. The saved parameters are the current values. Saved changes are activated when they are installed or the PAS (product address space) is restarted.

You can use the same primary and line commands from this view as from DWKLDDEF. Before you can use these commands, you must first type EDIT on the COMMAND line.

The window information line changes from BROWSE to EDIT.

Online help describes how to use these commands. Select the view name with your cursor, press your HELP key, and then select Actions from the help window.

---

## Chapter 8. Using SSI Contexts

One of the most powerful features of windows mode is its ability to combine data from multiple targets in one view in single system image (SSI) mode. Even the data from DB2 subsystems operating on different MVS images can be brought together.

The default SSI context of ALL is always available and is the one set if you enter windows mode from the DB2 Primary Option Menu. There may be other SSI contexts already defined that group several similar DB2s together, such as PROD or TEST, or a data sharing group.

As you navigate between MVDB2 views, it is often necessary to set another context to look at a different group of DB2s or at a single DB2. You may want to switch out of SSI mode to analyze one DB2 target, or remain in SSI mode but temporarily narrow the focus. This focus is called SCOPE.

The DB2 Easy Menus have utility options to set context. From EZDSSI, you can hyperlink to view a list of defined contexts and select one to reset the context. From EZDB2 and EZDBA, you can hyperlink to view a list of target DB2s and select one to reset the context to a new target.

---

### Using Commands to Change Context

There are four commands that affect the current context. When you know the name of the target or SSI context you need, you can type the information directly in one of these ways.

For more details about these commands, type HELP followed by the command name; for example, HELP CON.

#### CONtext Command

The CONtext command is the fastest way to switch between contexts. The syntax of the command is

```
CONtext target product; view
```

The product and view names are optional. For example, type

```
CON DBGG
```

to change the context to the data sharing group DBGG that has been previously defined as an SSI context.

CONtext establishes the current context, product, and target for the active window. Subsequent views displayed in that window inherit these values.

#### SET Command

The SET command invokes an ISPF dialog to display a panel where you can overtype context values. You can change context, product, server, scope, and view. Like CONtext, it sets these values for the current window. Type HELP SET for more details.

### SETD Command

The SETD command is similar to SET in that it invokes an ISPF dialog to display a panel where you can overwrite context values. You can change context, product, and scope. SETD changes the default settings of new windows but does not affect the context of the current window. It is useful when several windows need to be opened to a new context.

### SCOPE Command

You can restrict views within an SSI context to show data from a single target using the SCOPE command. The syntax of this command is:

```
SCOpe target |*
```

Target narrows the focus to one target. The asterisk reverses back to the full SSI context.

---

## Plex Manager Views of SSI Contexts

Plex Manager provides views that show you the defined SSI contexts and the targets within the contexts. Type

```
CON * PLEXMGR; CONACTZ
```

to view a summary list of all the SSI contexts known to the current Plex Manager. It shows the number of targets and number of active targets. You can use this command whenever you need to review the SSI contexts available to you.

A hyperlink from CONACTZ shows you all the targets in the selected context in the view CONACT.

Additional dialogs allow the definition of new SSI contexts. Refer to the *MAINVIEW Administration Guide* if you need to perform this function. These views are available through the ADMIN list of views on the MVDB2 MAIN menu.

## Chapter 9. Securing Resources

This chapter discusses how to update security for the MAINVIEW for DB2 resources.

External security managers (ESMs), such as CA-ACF2, CA-TOP SECRET, or RACF can be used to protect access to a product and its resources, such as views, view actions or commands, and data. Product resources are identified to your ESM as a resource entity that can be protected so that existing security rules, permits, or profiles can be used.

Using the security resource administration views, you can see the access authorizations that are enabled for the MAINVIEW for DB2 resources by default. These views are SERDEF and SERDEFE. You can use them to enable, disable, and change security resource definitions. For information about securing resources, see *Implementing Security for MAINVIEW Products*.

### SERDEF—Security Resource Definitions

You can use the SERDEF view, shown in [Figure 14](#), to disable or enable resource definitions or to select one to view and change its attributes.

```

>WI =SERDEF=====DB2J=====*(00 BROWSE      )====MVDB2=====22
CMD Description                               Enab
-----

Status - Table Data                          Yes
SQL Cache StmtS - Table Data                 Yes
Users - Table Data                           Yes
ZPARM - Table Data                           Yes
ZPARM - Any Action                           Yes

```

Figure 14. SERDEF View—Security Resource Definitions

You can select the SERDEF view at any time by typing one of the following on the COMMAND line:

- **SERDEF**  
Provides direct access to a list of existing resource definitions.
- **ADMIN**  
Groups views by system and operations administration functions and is available from the MAIN menu for MVDB2. Select SERDEF from the list of views.
- **VIEWS**  
Provides an alphabetical list of all views. Select SERDEF from the list of views.

*Implementing Security for MAINVIEW Products* describes how to use the SERDEF view.

## SERDEFE—Security Resource Definition Detail

The SERDEFE view, shown in [Figure 15](#), provides detailed information about a resource definition selected from the SERDEF view. It shows the class and entity names and other attributes for that definition.

## Chapter 10. Alphabetical List of Views

Table 1 and Table 2 provide alphabetical lists of all the windows-mode views with page references to their descriptions in this manual. Table 2 on page 57 lists the monitor plot views and Table 1 lists all other windows-mode views available with MAINVIEW for DB2.

Table 1. Windows-Mode Views

View Name	Title	Page
BFRPL	Buffer Pool Statistics—SSI	132
BFRPLD	Local Buffer Pool Statistics Detail	133
BFRPLH	Buffer Pool Rates—SSI	134

## Alphabetical List

---

## Chapter 11. DB2 Systems

The DB2 system views provide an enormous amount of data about how a DB2 subsystem is running. This data includes

- Many status indicators, including warning flags and utilization measurements (pools, paging, and so forth)
- All DB2 statistics fields (IFCIDs 1 and 2)
- Buffer pool statistics totals
- DDF location statistics totals
- Additional statistics on group buffer pools for data sharing

Views for DB2 system analysis are organized into several groups, as follows:

- DB2 system status views
- User activity views
- Lock views
- Pool / page set views
- EDM pool views
- Logging views
- DDF views

For each major area, there are SSI views of the most important interval statistics per DB2. Most SSI views have a hyperlink to a detail view showing all related fields as both interval and session values for the selected DB2.

Each SSI view also can be expanded to show a different time perspective, either multiple intervals per DB2, or even an earlier time period. Use the `TIME` command to retrieve the historical data. You can use the command, `INCLUDE TIME`, to display a column showing the time; `EXCLUDE TIME` removes it from the display.

You can easily access all the views for DB2 systems analysis from the DB2 Status Easy Menu (EZDSTAT), shown in Figure 16.

```

Figure 16. EZDSTAT Easy Menu—DB2 Status

There is also an Easy Menu, EZDSTATD, which provides similar options when looking at just one DB2. EZDSTAT hyperlinks generally go to tabular views that show one row per DB2 in the current context. EZDSTATD hyperlinks go directly to the detail views for that DB2.

Table 3 lists all the views available for DB2 systems.

Table 3. DB2 System Views

View Name	Group / Type	Description
STAGENT	User Activity	Agent Services (see page 93)
	Tabular	Provides statistics about agent services in the current interval.
STAGENTD	User Activity	Agent Services Detail (see page 93)
	Detail	Provides statistics about agent services for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul>
STAUTH	User Activity	Authorization Checks (see page 98)
	Tabular	Provides statistics about authorization checks for PLANS, packages, and user-defined function or stored procedure routines.
STAUTHD	User Activity	Authorization Checks Detail (see page 99)
	Detail	Provides statistics about authorization checks for PLANS, packages, and user-defined function or stored procedure routines for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul>
STBFRPL	Pool / Page Set	Buffer Pool Statistics (see page 106)
	Tabular	Provides statistics about all defined buffer pools per DB2 in the current interval.  You can use this view to analyze total buffer pool activity in all pools combined. See Chapter 12, “Buffer Pools” on page 127 for views on individual pools.
STBFRPLD	Pool / Page Set	Buffer Pool Statistics Detail (see page 107)
	Detail	Provides statistics about all buffer pools in the selected DB2 for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> You can use this view to analyze total buffer pool activity.
STBIND	User Activity	Bind Statistics (see page 96)
	Tabular	Provides statistics about binds in the current interval.

Table 3. DB2 System Views (Continued)

View Name	Group / Type	Description
STBINDD	User Activity Detail	Bind Statistics Detail (see page 97)  Provides statistics about binds for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul>
STCHKP	Logging Tabular	Checkpoint Data (see page 121)  Provides statistics about checkpoint activity in the current interval. It also includes data capture statistics.
STCHKPD	Logging Detail	Checkpoint Data Detail (see page 121)  Provides statistics about checkpoint activity and data capture for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul>
STCMDS	System Status Tabular	DB2 Commands (see page 88)  Provides statistics about DB2 commands executed in the current interval.
STCMDSD	System Status Detail	DB2 Commands Detail (see page 89)  Provides statistics about DB2 commands executed for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul>
STDB2	System Status Tabular	DB2 Activity Overview (see page 75)  SSI overview of the status of all DB2 subsystems in the context. For each DB2, it displays activity rates, number of exceptions, and warning flags.  You can use this view to check the level of activity per DB2 and quickly determine if exceptions are outstanding.
STDB2D	System Status Detail	DB2 Status Detail—Interval (see page 76)  Shows the overall status and activity within the selected DB2 subsystem for the current recording interval.  You can use this view to see information concerning key indicators that apply to the entire subsystem, such as active users, threads by type, DB2 CPU usage, locking, paging, and buffer and Environmental Data Manager (EDM) pool activity and status. Exception conditions detected by the background Exception Sampler or active MVDB2 monitors are also shown. This information provides an overall view of DB2 system activity and shows problems within DB2 that can be diagnosed with MVDB2 facilities.

Table 3. DB2 System Views (Continued)

View Name	Group / Type	Description
STDB2DS	System Status Detail	<p>DB2 Status Detail—Session (see page 78)</p> <p>Shows the overall status and activity within the selected DB2 subsystem for the current session since DB2 was started.</p> <p>You can use this view to see information concerning key indicators that apply to the entire subsystem, such as active users, threads by type, DB2 CPU usage, locking, paging, and buffer and Environmental Data Manager (EDM) pool activity and status. Exception conditions detected by the background Exception Sampler or active MVDB2 monitors are also shown. This information provides an overall view of DB2 system activity and shows problems within DB2 that can be diagnosed with MVDB2 facilities.</p>
STDB2SYS	System Status Tabular	<p>DB2 System Information (see page 84)</p> <p>Provides DB2 system information on CPU utilization in the current interval.</p> <p>You can use this view to compare the CPU usage per DB2 address space.</p>
STDBSYSD	System Status Detail	<p>DB2 System Information Detail (see page 85)</p> <p>Provides DB2 system information for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to see CPU usage for all DB2 address spaces. Some additional diagnostic fields are included.</p>
STDDF	DDF Tabular	<p>DDF Statistics (see page 122)</p> <p>Provides statistics about total DDF activity for the current interval.</p> <p>You can use this view to analyze the total distributed requests sent and received per DB2.</p>
STDDFD	DDF Detail	<p>DDF Statistics Detail (see page 123)</p> <p>Provides statistics about total DDF activity for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to analyze the total distributed requests sent and received per DB2.</p>
STDIST	DDF Tabular	<p>DBAT Statistics (see page 124)</p> <p>Provides statistics about Database Access Threads (DBATs) for the current interval.</p> <p>You can use this view to analyze thread usage for distributed requests where this DB2 was acting as the server.</p>

Table 3. DB2 System Views (Continued)

View Name	Group / Type	Description
STDISTD	DDF Detail	<p>DBAT Statistics Detail (see page <a href="#">125</a>)</p> <p>Provides statistics about DBATs for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to analyze thread usage for distributed requests where this DB2 was acting as the server.</p>
STDSA	Pool / Page Set Tabular	<p>Data Set Activity (see page <a href="#">116</a>)</p> <p>Provides statistics about data set activity in the current interval.</p> <p>You can use this view to analyze open/close activity.</p>
STDSAD	Pool / Page Set Detail	<p>Data Set Activity Detail (see page <a href="#">116</a>)</p> <p>Provides statistics about data set activity for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to analyze open/close activity.</p>
STEDMP	EDM Pool Tabular	<p>EDM Pool Statistics (see page <a href="#">117</a>)</p> <p>Provides statistics about the EDM pool in the current interval.</p> <p>You can use this view to analyze EDM pool utilization and performance.</p>
STEDMPD	EDM Pool Detail	<p>EDM Pool Statistics Detail (see page <a href="#">118</a>)</p> <p>Provides statistics about the EDM pool for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to analyze EDM pool utilization and performance.</p>
STEXC	System Status Tabular	<p>Exception Conditions (see page <a href="#">80</a>)</p> <p>Provides an overview of exception conditions.</p> <p>You can use this view to see in more detail which types of exceptions may be outstanding per DB2. Hyperlinks lead to more detail for each kind of exception.</p>

Table 3. DB2 System Views (Continued)

View Name	Group / Type	Description
STGBFRPD	Pool / Page Set Detail	<p>Global Buffer Pool Statistics Detail (see page 110)</p> <p>Provides statistics about group buffer pools for each of these time periods:</p> <ul style="list-style-type: none"> <li>The current recording interval</li> <li>The current session since DB2 was started</li> </ul> <p>You can use this view to analyze activity in the group buffer pools for one data sharing member in all pools combined. See <a href="#">Chapter 12, “Buffer Pools” on page 127</a> for views per individual buffer pool.</p>
STGBFRPL	Pool / Page Set Tabular	<p>Global Buffer Pool Statistics (see page 109)</p> <p>Provides statistics about group buffer pools in the current interval.</p> <p>You can use this view to analyze total global activity in the group buffer pools for data sharing in all pools combined. See <a href="#">Chapter 12, “Buffer Pools” on page 127</a> for views per individual buffer pool.</p>
STGBGRPD	Pool / Page Set Detail	<p>Global Buffer Pool Group Statistics Detail (see page 114)</p> <p>Provides statistics about group buffer pools for each of these time periods:</p> <ul style="list-style-type: none"> <li>The current recording interval</li> <li>The current session since DB2 was started</li> </ul> <p>You can use this view to analyze total global activity in the group buffer pools for data sharing in all pools and all DB2 members combined. See <a href="#">Chapter 12, “Buffer Pools” on page 127</a> for views per individual buffer pool.</p>
STGBLLK	Lock Tabular	<p>Global Locking (see page 104)</p> <p>Provides statistics about global locking in the current interval.</p> <p>You can use this view to analyze global locking activity and the level of global contention.</p>
STGBLLKD	Lock Detail	<p>Global Locking Detail (see page 105)</p> <p>Provides statistics about global locking for each of these time periods:</p> <ul style="list-style-type: none"> <li>The current recording interval</li> <li>The current session since DB2 was started</li> </ul> <p>You can use this view to analyze global locking activity and the level of global contention.</p>
STHITR	Pool / Page Set Tabular	<p>Hit Ratios (see page 108)</p> <p>Provides statistics about hit ratios in the current interval.</p> <p>You can use this view to analyze buffer pool performance. The values used in the calculations are included in the view.</p>

Table 3. DB2 System Views (Continued)

View Name	Group / Type	Description
STHITRD	Pool / Page Set Detail	<p>Hit Ratios Detail (see page 108)</p> <p>Provides statistics about hit ratios for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to analyze buffer pool performance. The values used in the calculations are included in the view.</p>
STLOCK	Lock Tabular	<p>Lock Statistics (see page 102)</p> <p>Provides statistics about locks in the current interval.</p> <p>You can use this view to analyze lock activity and the amount of contention.</p>
STLOCKD	Lock Detail	<p>Lock Statistics Detail (see page 103)</p> <p>Provides statistics about locks for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to analyze lock activity and the amount of contention.</p>
STLOG	Logging Tabular	<p>Log Statistics (see page 119)</p> <p>Provides statistics about logging in the current interval.</p> <p>You can use this view to analyze activity on the active and archive logs and the BSDS. Problems such as unavailable buffers for logging, or reads from archive logs for backouts can be detected.</p>
STLOGD	Logging Detail	<p>Log Statistics Detail (see page 120)</p> <p>Provides statistics about logging for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to analyze activity on the active and archive logs and the BSDS. Problems such as unavailable buffers for logging, or reads from archive logs for backouts can be detected.</p>
STQPAR	System Status Tabular	<p>Query Parallelism (see page 86)</p> <p>Provides statistics about query parallelism in the current interval.</p> <p>You can use this view to identify how often query parallelism is being used.</p>

Table 3. DB2 System Views (Continued)

View Name	Group / Type	Description
STQPARD	System Status Detail	<p>Query Parallelism Detail (see page 87)</p> <p>Provides statistics about query parallelism for each of these time periods:</p> <ul style="list-style-type: none"> <li>The current recording interval</li> <li>The current session since DB2 was started</li> </ul> <p>You can use this view to analyze parallelism activity on one DB2.</p>
STRATE	System Status Detail	<p>Activity Rates (see page 83)</p> <p>Provides the most critical measurements as quantities and rates per second, per thread, and per commit.</p> <p>You can use this view to analyze activity in one DB2 for both the current interval and since that DB2 started. The rate calculations give you values that make it easier to compare current activity with the totals accumulated over a longer time span.</p>
STRID	Pool / Page Set Tabular	<p>RID Pool Statistics (see page 115)</p> <p>Provides statistics about the RID pool per DB2 for the current interval.</p> <p>You can use this view to analyze RID pool usage and failures.</p>
STRIDD	Pool / Page Set Detail	<p>RID Pool Statistics Detail (see page 115)</p> <p>Provides statistics about the RID pool for one DB2 for each of these time periods:</p> <ul style="list-style-type: none"> <li>The current recording interval</li> <li>The current session since DB2 was started</li> </ul> <p>You can use this view to analyze RID pool usage and failures.</p>
STROUT	User Activity Tabular	<p>Routine Statistics (see page 100)</p> <p>Provides statistics about cascading, stored procedure, trigger, and user-defined function routines.</p>
STROUTD	User Activity Detail	<p>Routine Statistics Detail (see page 101)</p> <p>Provides statistics about cascading, stored procedure, trigger, and user-defined function routines for each of these time periods:</p> <ul style="list-style-type: none"> <li>The current recording interval</li> <li>The current session since DB2 was started</li> </ul>
STSERV	User Activity Tabular	<p>Subsystem Services (see page 94)</p> <p>Provides statistics about subsystem services.</p>

Table 3. DB2 System Views (Continued)

View Name	Group / Type	Description
STSERVD	User Activity Detail	Subsystem Services Detail (see page 95)  Provides statistics about subsystem services for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul>
STSQL	User Activity Tabular	SQL Counts (see page 91)  Provides statistics about SQL counts in the current interval.  You can use this view to see what type of SQL activity is occurring.
STSQLD	User Activity Detail	SQL Counts Detail (see page 92)  Provides statistics about SQL counts for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> You can use this view to see what types of SQL activity are occurring.
STUSUMM	User Activity Tabular	User Summary (see page 90)  Provides summary statistics about current user connections.  You can use this view to determine the current level of activity per DB2.
STUSUMMD	User Activity Detail	User Summary Detail (see page 90)  Provides summary statistics about each type of user connection.
STWARN	System Status Detail	Warning/Error Conditions (see page 81)  Provides information about the most important key indicators of failures or degradation.  You can use this view to see all the warning indicators that are set to Yes.

**Note:** The statistics views STCACHE and STCACHED on the dynamic SQL cache are included in [Chapter 18, “Dynamic SQL Cache” on page 247](#).

## DB2 System Status Views

The following views display information about DB2 system status.

### STDB2—DB2 Activity Overview

The STDB2 view, shown in [Figure 17](#), is an SSI overview of the status of all DB2 subsystems in the context. For each DB2, it displays activity rates, number of exceptions, and warning flags.

```
>W1 =EZDSTAT==STDB2====(ALL=====*)=====) 17MAR2001==17: 43: 40====MVB2====D====8
```

DB2	Act	Comm	Getpg	Lockout	Tot	Exc	Warning	Msg	Dataset	Dataset	GB
Target	Thrd	Rate	Rate	Rate	Exc				In-Use	Open	
DB0GMV54	0	0.0	0.0	0.0	0	0	Connect	Fail	0		
DB0HMV55	0	0.0	0.0	0.0	0	0	Connect	Fail	0		
DB1FMV53	0	0.0	0.0	0.0	0	0	Connect	Fail	0		
DB1GMV54	1	0.0	0.1	0.0	0	0	GBL cont	>2%	0	37	
DB1HMV55	0	0.0	0.0	0.0	0	0	Connect	Fail	0		
DB2FMV53	0	0.0	0.0	0.0	0	0	Connect	Fail	0		
DB2GMV54	2	0.0	0.1	0.0	0	0	GBL cont	>2%	0	78	
DB2HMV55	2	0.0	0.0	0.0	0	0			1	13	

Figure 17. STDB2 View—DB2 Activity Overview

You can use this view to check the level of activity per DB2 and quickly determine if exceptions are outstanding.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STDB2D to see detailed statistics for the selected DB2 subsystem
  - Act Thrd column to THDACTV to see information about each active thread for one DB2
  - Comm Rate column to STRATE to see rates per second, per thread, and per commit
  - Getpg Rate column to BFRPL to see buffer pools for one DB2
  - Lockout Rate column to LKEVENT to see lockout events for one DB2
  - Tot Exc column to STEXC to see an overview of exception conditions
  - Warning Msg column to STWARN to see information about the most important key indicators of failures or degradation for that DB2
  - Dataset Open column to EZDPS menu to see page set information
  - Threads Conn column to THDCONNZ to see current thread activity summarized by connection name
  - Total HitRt column to BFRPLH to see an overview of buffer pool hit ratios
  - GBP Depndnt column to PSBPGBPZ to see a summary of group-buffer pool-dependent page sets

## STDB2D—DB2 Status Detail—Interval

The STDB2D view, shown in Figure 18, shows the overall status and activity within the selected DB2 subsystem for the current recording interval.

```

Figure 18. STDB2D View—DB2 Status Detail—Interval

You can use this view to see information concerning key indicators that apply to the entire subsystem, such as active users, threads by type, DB2 CPU usage, locking, paging, and buffer and Environmental Data Manager (EDM) pool activity and status. Exception conditions detected by the background Exception Sampler or active MVDB2 monitors are also shown. This information provides an overall view of DB2 system activity and shows problems within DB2 that can be diagnosed with MVDB2 facilities.

The default functions shipped with this view are as follows:

- Hyperlink from
  - EZ Menu field to the EZDSTATD menu to select views with data for the selected target only
  - Session field to STDB2DS to see these statistics for the current session since DB2 was started
  - TSO, Batch, -CAF, -Utility, IMS, CICS, DBAT, RRSAP, and \*Total\* fields to THDACTV to see information about each active thread for the selected connection type
  - BP Rates field to STBFRPLD to see detailed statistics about all buffer pools in this DB2
  - Locking field to LKEVENT to see lockout events for this DB2

- Exceptions field to STEXC to see an overview of exception conditions for this DB2
- Data Sets field to STDSAD to see detailed statistics about data set activity for this DB2
- Parallel field to STQPARD to see detailed statistics about query parallelism for this DB2
- STOPROCS field to STSQLD to see detailed statistics about SQL counts for this DB2
- Group BP field to STGBFRPD to see detailed statistics about group buffer pools in this DB2

## STDB2DS—DB2 Status Detail—Session

The STDB2DS view, shown in Figure 19, shows the overall status and activity within the selected DB2 subsystem for the current session since DB2 was started.

Figure 19. STDB2DS View—DB2 Status Detail—Session

You can use this view to see information concerning key indicators that apply to the entire subsystem, such as active users, threads by type, DB2 CPU usage, locking, paging, and buffer and Environmental Data Manager (EDM) pool activity and status. Exception conditions detected by the background Exception Sampler or active MVDB2 monitors are also shown. This information provides an overall view of DB2 system activity and shows problems within DB2 that can be diagnosed with MVDB2 facilities.

The default functions shipped with this view are as follows:

- Hyperlink from
  - EZ Menu field to the EZDSTATD menu to select views with data for the selected target only
  - TSO, Batch, -CAF, -Utility, IMS, CICS, DBAT, RRSAP, and \*Total\* fields to THDACTV to see information about each active thread for the selected connection type
  - BP Rates field to STBFRPLD to see detailed statistics about all buffer pools in this DB2
  - Locking field to LKEVENT to see lockout events for this DB2
  - Exceptions field to STEXC to see an overview of exception conditions for this DB2

- Data Sets field to STDSAD to see detailed statistics about data set activity for this DB2
- Parallel field to STQPARD to see detailed statistics about query parallelism for this DB2
- STOPROCS field to STSQLD to see detailed statistics about SQL counts for this DB2
- Group BP field to STGBFRPD to see detailed statistics about group buffer pools in this DB2

## STEXC—Exception Conditions

The STEXC view, shown in [Figure 20](#), provides an overview of exception conditions.

W1 =EZDSTAT==STEXC===(ALL=====*)=====) 17MAR2001==11: 14: 35====MVDB2====D====8							
Intvl	Intvl	DB2	SSI	Warning	System	User	
Time	Date	Target	System	Monitors	Exceptions	Exceptions	Warning Msg
11: 14	17MAR	DB2GMV54	SYSC	0	0	0	GBL cont >2%
11: 14	17MAR	DB1GMV54	SYSC	0	0	0	
11: 14	17MAR	DB2FMV53	SYSC	0	0	0	Connect Fail
11: 14	17MAR	DB1FMV53	SYSC	0	0	0	Connect Fail
11: 14	17MAR	DB0GMV54	SYSC	0	0	0	Connect Fail

11: 14	17MAR	DB1HMV55	SYSC	0	0	0	Connect Fail
11: 14	17MAR	DB0HMV55	SYSC	0	0	0	Connect Fail

Figure 20. STEXC View—Exception Conditions

You can use this view to see in more detail which types of exceptions may be outstanding per DB2. Hyperlinks lead to more detail for each kind of exception.

The default functions shipped with this view are as follows:

- [Hyperlink from](#)
  - [Warning Monitors](#) column to [DMWARN](#) to see a list of each active monitor whose threshold has been exceeded
  - [System Exceptions](#) column to the [DB2EX](#) analyzer display to see a list of system exception messages
  - [User Exceptions](#) column to the [DB2EX](#) analyzer display to see a list of user exception messages (“runaway query”)
  - [Warning Msg](#) column to [STWARN](#) to see information about the most important key indicators of failures or degradation

## STWARN—Warning/Error Conditions

The STWARN view, shown in [Figure 21](#), provides information about the most important key indicators of failures or degradation.

H1 =STDB2====STWARN====DB2G=====17MAR2001==15: 00: 13====MVDB2====D====1

Max TSO Users.....	No		

Figure 21. STWARN View—Warning/Error Conditions

You can use this view to see all the warning indicators that are set to Yes.

The default functions shipped with this view are as follows:

- Hyperlink from
  - Log DS Full, Last Log 75%, Single Logging, Single BSDS, Last Log, Archive Wait, and Archive Reads columns to DLOGS analyzer display to see log status and activity information
  - INDOUBT Threads and Runaway Query columns to DB2EX analyzer display to see exception messages
  - DM Critical, Imm Write Threshold, Defer Disable, Prefetch Disable, BP Expansions, Bpool Failures, and Expand Failures columns to BFRPL to see an overview of buffer pool activity
  - IMS/CICS Queued column to STUSUMM to see summary statistics about current user connections
  - DBAT Queued column to STDIST to see DBAT statistics
  - Conv Queued column to STDDF to see DDF statistics
  - GBL Contention>2% column to STGBLLK to see global locking statistics
  - EDM Failures column to STEDMP to see EDM pool statistics
  - Max TSO Users and Max Batch Users columns to THDCTYPZ to see a summary of current thread activity by connection type

- Max DS Open column to STDSA to see data set activity statistics
- RID Failures column to STRID to see RID pool statistics
- Parallel Fallback column to STQPAR to see query parallelism statistics
- GBP Failures column to GBPCFM to see group buffer pool coupling facility activity statistics
- DB2 Connect Failure column to the Log Display application to see message details

## STRATE—Activity Rates

The STRATE view, shown in [Figure 22](#), provides the most critical measurements as quantities and rates per second, per thread, and per commit.

H1 =STRATE=====DB2G=====*=====17MAR2001==15: 00: 13====MVDB2====D====1								
	Intvl	Sess	Intv	Sess	Intvl	Sess	Intvl	Sess

Figure 22. STRATE View—Activity Rates

You can use this view to analyze activity in one DB2 for both the current interval and since that DB2 started. The rate calculations give you values that make it easier to compare current activity with the totals accumulated over a longer time span.

The default functions shipped with this view are as follows:

- Hyperlink from
  - Commits column to STSERV to see statistics about subsystem services
  - Getpages column to BFRPL to see an overview of buffer pool activity
  - Lockouts column to LKEVENT to see details about timeout and deadlock events
  - LockSuspends column to STLOCK to see lock statistics
  - DML SQL column to STSQL to see SQL count statistics
  - RID Fails column to STRID to see RID pool statistics
  - EDM Loads column to STEDMP to see EDM pool statistics
  - Checkpoints column to STCHKP to see checkpoint activity statistics
  - Prll Groups column to STQPAR to see query parallelism statistics

## STDB2SYS—DB2 System Information

The STDB2SYS view, shown in [Figure 23](#), provides DB2 system information on CPU utilization in the current interval.

```
>W1 =STDB2SYS===== (ALL=====*)=====) 17MAR2001==11: 20: 21====MVDB2====D====8
```

DB2 Target	Proc Name	TCB	Time	SRB	Time	Proc Name	TCB	Time	SRB	Time	Proc Name
DB0GMV54						N/A					
DB0HMV55						N/A					
DB1FMV53						N/A					
DB1GMV54	MSTR	00: 00: 00. 65		00: 00: 00. 12		DBM1	00: 00: 00. 00		00: 00: 00. 16		DIST 0
DB1HMV55						N/A					
DB2FMV53						N/A					
DB2GMV54	MSTR	00: 00: 00. 73		00: 00: 00. 29		DBM1	00: 00: 00. 17		00: 00: 00. 23		DIST 0
DB2HMV55	MSTR	00: 00: 01. 82		00: 00: 00. 23		DBM1	00: 00: 00. 01		00: 00: 00. 11		DIST 0

Figure 23. STDB2SYS View—DB2 System Information

You can use this view to compare the CPU usage per DB2 address space.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STDBSYS to see interval and session counts

## STDBSYS—DB2 System Information Detail

The STDBSYS view, shown in [Figure 24](#), provides DB2 system information for each of these time periods:

- The current recording interval
- The current session since DB2 was started

W1 =STDB2SYS=STDBSYSD(ALL=====DB1GMV54) 17MAR2001==11: 20: 21====MVDB2====D====1

Figure 24. STDBSYS View—DB2 System Information Detail

You can use this view to see CPU usage for all DB2 address spaces. Some additional diagnostic fields are included.

## STQPAR—Query Parallelism

The STQPAR view, shown in [Figure 25](#), provides statistics about query parallelism in the current interval.

```
>W1 =STQPAR===== (ALL=====*)=====) 17MAR2001==11: 23: 31====MVDB2====D====8
```

DB2 Target	Max Parall	Total Groups	Fall back Cursor	Fall back Not ESA	Fall back No Buff	Fall back No Encl v	Less Than Planned
DB0GMV54	0	0	0	0	0	0	0
DB0HMV55	0	0	0	0	0	0	0
DB1FMV53	0	0	0	0	0	0	0
DB1GMV54	0	0	0	0	0	0	0
DB1HMV55	0	0	0	0	0	0	0
DB2FMV53	0	0	0	0	0	0	0
DB2GMV54	0	0	0	0	0	0	0
DB2HMV55	0	0	0	0	0	0	0

Figure 25. STQPAR View—Query Parallelism

You can use this view to identify how often query parallelism is being used.

The default functions shipped with this view are as follows:

- [Hyperlink from](#)
  - [DB2 Target column to STQPARD](#) to see interval and session counts

## STQPARD—Query Parallelism Detail

The STQPARD view, shown in Figure 26, provides statistics about query parallelism for each of these time periods:

- The current recording interval
- The current session since DB2 was started

WI =STQPAR===STQPARD=(ALL=====DB2J61E=) 17MAR2001==18: 29: 00====MVDB2====D====1		
	Interval	Session
Parallel Execution.....		
Max Degree of Parallelism.....		1
Total Parallel Groups Executed.....	1	3
Groups Ran at Planned Degree.....	0	0
Groups Ran Reduced from Planned Degree	1	3

## STAUTH—Authorization Checks

The STAUTH view, shown in [Figure 39](#), provides statistics about authorization checks for PLANs, packages, and user-defined function or stored procedure routines.

**Note:** Many of the fields in this view show significant data only if the target subsystem is running DB2 6.1 or later.

```

>W1 =STAUTH===== (ALL===== *=====) 17MAR2001==17: 39: 40====MADB2====D====2

Figure 46. STGBLLKD View—Global Locking Detail

You can use this view to analyze global locking activity and the level of global contention.

## Pool/Page Set Views

The following views display information about pools and page sets.

### STBFRPL—Buffer Pool Statistics

The STBFRPL view, shown in [Figure 47](#), provides statistics about all defined buffer pools per DB2 in the current interval.

```
>WI =STBFRPL===== (ALL=====*=====) 17MAR2001==12: 08: 29====M=VDB2====D====7
```

DB2 Target	Buff Alloc	Activ Buff	Expand/ Contract	Buffer Fails	Expand Fails	HP Exp Buffers	HP Alloc	HP Exp Contract	V G
DB0GMV54	0	0	0	0	0	0	0	0	0

DB2HMV55	200	0	0	0	0	0	0	0	0

Figure 47. STBFRPL View—Buffer Pool Statistics

You can use this view to analyze total buffer pool activity in all pools combined. See [Chapter 12, “Buffer Pools” on page 127](#) for views on individual pools.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STBFRPLD to see interval and session counts
  - Buff Alloc column to BFRPL to see buffer pool information for one DB2

## STBFRPLD—Buffer Pool Statistics Detail

The STBFRPLD view, shown in [Figure 48](#), provides statistics about all buffer pools in the selected DB2 for each of these time periods:

- The current recording interval
- The current session since DB2 was started

Figure 48. STBFRPLD View—Buffer Pool Statistics Detail

You can use this view to analyze total buffer pool activity.

The default functions shipped with this view are as follows:

- Hyperlink from
  - Buffers Allocated field to BFRPL to see an overview of buffer pool activity

## STHITR—Hit Ratios

The STHITR view, shown in Figure 49, provides statistics about hit ratios in the current interval.

```
>W1 =EZDSTAT==STHITR==(ALL=====*) 17MAR2001==12: 07: 40====MVDB2====D====8
```

DB2 Target	Hit Rate w/o PF	Hit Rate with PF	Get- pages	Sync Reads	PF Reads	List PF Reads	Dynam PF	Seq Req	Co
DB0GMV54	0	0	0	0	0	0	0	0	0

DB2GMV54	100	100	140	0	0	0	0	0	0
DB2HMV55	100	100	12	0	0	0	0	0	0

Figure 49. STHITR View—Hit Ratios

You can use this view to analyze buffer pool performance. The values used in the calculations are included in the view.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STHITRD to see interval and session counts
  - Hit Rate w/o PF column to BFRPLH to see an overview of hit ratios and the most critical buffer pool activity measurements

## STHITRD—Hit Ratios Detail

The STHITRD view, shown in Figure 50, provides statistics about hit ratios for each of these time periods:

- The current recording interval
- The current session since DB2 was started

```
W1 =EZDSTAT==STHITRD=(ALL=====DB1GMV54) 17MAR2001==12: 07: 40====MVDB2====D====1
```

	Interval	Session

DB2FMV53	0	0	0	0	0	0
DB2HMV55	0	0	0	0	0	0

Figure 51. STGBFRPL View—Global Buffer Pool Statistics

You can use this view to analyze total global activity in the group buffer pools for data sharing in all pools combined. See [Chapter 12, “Buffer Pools” on page 127](#) for views per individual buffer pool.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STGBFRPD to see interval and session counts for that DB2 target
  - GBP Changed Sync Writes column to GBPWRITZ to see statistics about group buffer pool write activity
  - GBP Castouts column to GBPCASTZ to see statistics about castout activity
  - Asyn Reads with Data column to GBPREADZ to see statistics about group buffer pool read activity
  - CF Write No Engine column to GBPCFZ to see statistics about the coupling facility

## STGBFRPD—Global Buffer Pool Statistics Detail

The STGBFRPD view, shown in [Figure 52](#), provides statistics about group buffer pools for each of these time periods:

- The current recording interval
- The current session since DB2 was started

```

Figure 54. STRID View—RID Pool Statistics

You can use this view to analyze RID pool usage and failures.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STRIDD to see interval and session counts

## STRIDD—RID Pool Statistics Detail

The STRIDD view, shown in [Figure 55](#), provides statistics about the RID pool for one DB2 for each of these time periods:

- The current recording interval
- The current session since DB2 was started

```

WI =STRID====STRIDD== (ALL=====DB0HMV55) 17MAR2001==12: 12: 42====M/DB2====D====1
          Interval  Sessi on
RID High Blocks Allocated...          0
RID Current Blocks Allocated          0

RID Processing Terminated:..
  Over RDS Limit.....          0     0
  Over DM Limit.....          0     0
  No Storage.....          0     0
  Too Many Concurrent.....          0     0

```

Figure 55. STRIDD View—RID Pool Statistics Detail

You can use this view to analyze RID pool usage and failures.

## STDSA—Data Set Activity

The STDSA view, shown in [Figure 56](#), provides statistics about data set activity in the current interval.

```

>W1 =STDSA===== (ALL===== *=====) 17MAR2001==17: 41: 29====MVDB2====D====2
DB2      Intvl  Dsets  Max  Success.  Cur.  Max  Reopen  Closed  Con
Target   Time   Open  Open    Opens  DefCls  DefCls  Def.  Clos  by Drain  RW

  Closed by Drain (99% Max)....       0   0

  Converted from RW to RO.....        0   0

  Migrated Data Sets.....             0   0
  Recall Timeouts.....                0   0
    
```

Figure 57. STDSAD View—Data Set Activity Detail

You can use this view to analyze open/close activity.

## EDM Pool Views

The following views display information about EDM pools.

### STEDMP—EDM Pool Statistics

The STEDMP view, shown in [Figure 58](#), provides statistics about the EDM pool in the current interval.

```
>W1 =STEDMP===== (ALL=====*) 17MAR2001==13: 53: 18====MVB2====D====1
DB2      Pool  NS %   NS % Util  Tot %  DBD   CT   SKCT  PKG   SKPKG
Target   Fails  Util 0. . . . 50. . . 100  Util  Pages  Pages  Pages  Pages
DB1HSR   0      0.0                                0.0   0     0     0     0     0
```

Figure 58. STEDMP View—EDM Pool Statistics

You can use this view to analyze EDM pool utilization and performance.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STEDMPD to see interval and session counts
  - DBD Pages column to the EDMPL Database Descriptors analyzer display to see detailed information about each database descriptor in the EDM pool
  - Free Pages column to the EDMPL Free Storage analyzer display to see detailed information about free pages in the EDM pool

## STEDMPD—EDM Pool Statistics Detail

The STEDMPD view, shown in [Figure 59](#), provides statistics about the EDM pool for each of these time periods:

- The current recording interval
- The current session since DB2 was started

WI =STEDMP===STEDMPD=(ALL=====DB1HSR==) 17MAR2001==13: 53: 18====MVDB2=====

Figure 59. STEDMPD View—EDM Pool Statistics Detail

You can use this view to analyze EDM pool utilization and performance.

## Logging Views

The following views display information about logging activity.

### STLOG—Log Statistics

The STLOG view, shown in [Figure 60](#), provides statistics about logging in the current interval.

```
>W1 =STLOG===== (ALL=====*) 17MAR2001==12: 18: 10====MVB2====D====7
```

DB2 Target	Nowait Writes	Force Writes	Buffer Uavail	CI s Created	Write Requests	Buffer Reads	Active Reads	Archive Reads
DB0GMV54	0	0	0	0	0	0	0	0
DB0HMV55	0	0	0	0	0	0	0	0
DB1FMV53	0	0	0	0	0	0	0	0
DB1GMV54	0	0	0	0	0	0	0	0
DB1HMV55	0	0	0	0	0	0	0	0
DB2FMV53	0	0	0	0	0	0	0	0
DB2HMV55	0	43	0	0	43	0	0	0

Figure 60. STLOG View—Log Statistics

You can use this view to analyze activity on the active and archive logs and the BSDS. Problems such as unavailable buffers for logging, or reads from archive logs for backouts can be detected.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STLOGD to see interval and session counts
  - Nowait Writes column to the DLOGS analyzer display to see detailed information about log status, configuration, and activity for the selected DB2

## STLOGD—Log Statistics Detail

The STLOGD view, shown in [Figure 61](#), provides statistics about logging for each of these time periods:

- The current recording interval
- The current session since DB2 was started

W1 =STLOG====STLOGD==(ALL=====DB2J61E=) 17MAR2001==18: 26: 23====MVDB2====D====1		
	Interval	Session

DB2HMV55	0	0	0	0	0	0	0	0	0

Figure 64. STDDF View—DDF Statistics

You can use this view to analyze the total distributed requests sent and received per DB2.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STDDFD to see interval and session counts
  - Conv Queued column to the DDFSM analyzer display to see summary statistics about data flow between remote locations

## STDDFD—DDF Statistics Detail

The STDDFD view, shown in [Figure 65](#), provides statistics about total DDF activity for each of these time periods:

- The current recording interval
- The current session since DB2 was started

W1 =STDDF====STDDFD==(ALL=====DB1FMV53) 17MAR2001==12: 31: 21====MVDB2====D====1

Figure 65. STDDFD View—DDF Statistics Detail

You can use this view to analyze the total distributed requests sent and received per DB2.

## STDIST—DBAT Statistics

The STDIST view, shown in [Figure 66](#), provides statistics about Database Access Threads (DBATs) for the current interval.

DB2	New DBATs	Convs	New Type	Connects	Max Remote	Current	M
Target	Queued	Deal loc	2 Queued	Termi nated	Connections	Actv DBAT	A
DB1HSR	0	0	0	0	0	0	0

Figure 66. STDIST View—DBAT Statistics

You can use this view to analyze thread usage for distributed requests where this DB2 was acting as the server.

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Target column to STDISTD to see interval and session counts
  - New DBATs Queued column to the DDFSM analyzer display to see summary statistics about data flow between remote locations

## STDISTD—DBAT Statistics Detail

The STDISTD view, shown in [Figure 67](#), provides statistics about DBATs for each of these time periods:

- The current recording interval
- The current session since DB2 was started

WI =STDIST===STDISTD=(ALL=====DB1HSR==) 17MAR2001==13: 49: 08====MVDB2=====		
	Interval	Session
<b>Maxiums Reached.....</b>		
New DBATs Queued (MAXDBAT).....	0	0

Figure 67. STDISTD View—DBAT Statistics Detail

You can use this view to analyze thread usage for distributed requests where this DB2 was acting as the server.

## Chapter 12. Buffer Pools

Views for buffer pool analysis are organized into two groups:

- Local buffer pool views (virtual pools and hiperpools)
- Global buffer pool views (group buffer pools for data sharing)

You can easily access all the views for buffer pool analysis from the DB2 Buffer Pool Easy Menu (EZDBFRPL), as shown in [Figure 68](#).

```

W1 =EZDBFRPL=====DB2GMV54=*=====17MAR2001==10: 39: 45====MVDB2====D====1
                                DB2 Buffer Pool Menu
Local Pools                      Global Pools
. Overview                        +-----+ . Group CF Status
. Activity Rates                  | Place cursor on | . Group CF Activity
                                | menu item and  |
Tools And Menus                  | press ENTER   | . Read Activity
. Set Context                    +-----+ . Write Activity
                                |                   | . Castout Activity
. Return...                      |                   | . Coupling Facility
                                |                   | . P-Lock Activity

```

Figure 68. EZDBFRPL Easy Menu—DB2 Buffer Pools

Table 4 lists all the views available for buffer pools.

Table 4. Buffer Pool Views

View Name	Group / Type	Description
BFRPL	Local Pools  Tabular	<p>Buffer Pool Statistics—SSI (see page 132)</p> <p>Provides an overview of buffer pool activity in the current interval. It can be invoked for one DB2 or in SSI mode for multiple DB2s; for example, a data sharing group to see member activity.</p> <p>You can use this view to review total buffer allocation and usage per pool. You can select any buffer pool to see further details.</p>
BFRPLD	Local Pools  Detail	<p>Local Buffer Pool Statistics Detail (see page 133)</p> <p>Provides threshold settings and detailed local buffer pool statistics for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>Scroll down to see further details.</p> <p>You can use this view to analyze activity and threshold settings for an individual buffer pool. Both virtual pool and hiperpool information is included.</p>
BFRPLH	Local Pools  Tabular	<p>Buffer Pool Rates—SSI (see page 134)</p> <p>Provides an overview of hit ratios and the most critical buffer pool activity measurements as rates per second in the current interval. It can be invoked for one DB2 or in SSI mode for multiple DB2s; for example, a data sharing group to see member activity.</p> <p>You can use this view to compare the most important indicators of buffer pool performance for all pools.</p>
BFRPLHD	Local Pools  Detail	<p>Buffer Pool Rates Detail (see page 135)</p> <p>Provides the most critical measurements for the selected buffer pool as hit ratios and rates per second for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to determine overall activity since DB2 started and whether the current interval shows a significant deviation.</p>

Table 4. Buffer Pool Views (Continued)

View Name	Group / Type	Description
GBPACTD	Global Pools	Group Buffer Pool Activity Detail (see page 150)
	Detail	<p>Provides all statistics about a single group buffer pool for one DB2 member for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to see group buffer pool total activity details (reads, writes, castouts, coupling facility data) for one member and pool.</p>
GBPCASTM	Global Pools	Group Buffer Pool Castout Activity (see page 145)
	Tabular	<p>Provides statistics about castout activity per pool for each DB2 member currently connected to it.</p> <p>You can use this view to analyze group buffer pool castout activity for each DB2 member.</p>
GBPCASTZ	Global Pools	Group Buffer Pool Castout Activity Summary (see page 144)
	Summary	<p>Provides statistics about castout activity. It is a summary of activity from each DB2 data sharing member currently connected to one or more pools.</p> <p>You can use this view to analyze group buffer pool castout activity from the viewpoint of the DB2 members. It shows all castout-related counts.</p>
GBPCFM	Global Pools	Group Buffer Pool Coupling Facility Activity (see page 149)
	Tabular	<p>Provides statistics about coupling facility activity per pool for each DB2 member currently connected to it.</p> <p>You can use this view to analyze group buffer pool coupling facility activity for each DB2 member.</p>
GBPCFZ	Global Pools	Group Buffer Pool Coupling Facility Summary (see page 148)
	Summary	<p>Provides statistics about the coupling facility. It is a summary of activity from each DB2 data sharing member currently connected to one or more pools.</p> <p>You can use this view to analyze group buffer pool coupling facility activity from the viewpoint of the DB2 members. It shows coupling facility activity and failure counts.</p>

Table 4. Buffer Pool Views (Continued)

View Name	Group / Type	Description
GBPGACD	Global Pools Detail	<p>Group Buffer Pool Group Coupling Facility Activity Detail (see page 139)</p> <p>Provides statistics about group buffer pool activity for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to view all available activity counts for a single group buffer pool from a global coupling facility viewpoint.</p>
GBPGACZ	Global Pools Summary	<p>Group Buffer Pool Group Coupling Facility Activity (see page 138)</p> <p>Provides statistics about group buffer pool activity.</p> <p>You can use this view to analyze the activity in all group buffer pools from a global coupling facility viewpoint.</p>
GBPGSTD	Global Pools Detail	<p>Group Buffer Pool Group Coupling Facility Status Detail (see page 137)</p> <p>Provides statistics about group buffer pool status for each of these time periods:</p> <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul> <p>You can use this view to view the group buffer pool definitions, current usage, and a few measurements of reclaim activity from a global coupling facility viewpoint.</p>
GBPGSTZ	Global Pools Summary	<p>Group Buffer Pool Group Coupling Facility Status (see page 136)</p> <p>Provides statistics about group buffer pool status.</p> <p>You can use this view to analyze the status of all active group buffer pools from a global coupling facility viewpoint. It also shows how many DB2 members are currently connected to each pool.</p>
GBPLOCKM	Global Pools Tabular	<p>Group Buffer Pool P-Lock Activity (see page 147)</p> <p>Provides statistics about group buffer pool P-Lock activity per pool for each DB2 member currently connected to it.</p> <p>You can use this view to analyze group buffer pool P-Lock activity for each DB2 member.</p>

Table 4. Buffer Pool Views (Continued)

View Name	Group / Type	Description
GBPLOCKZ	Global Pools Summary	<p>Group Buffer Pool P-Lock Activity Summary (see page 146)</p> <p>Provides statistics about group buffer pool P-Lock activity. It is a summary of activity from each DB2 data sharing member currently connected to one or more pools.</p> <p>You can use this view to analyze group buffer pool P-Lock activity from the viewpoint of the DB2 members.</p>

## Local Buffer Pool Views

The following views display information about local buffer pools. This includes both the virtual pools and any related hiperpools.

### BFRPL—Buffer Pool Statistics—SSI

The BFRPL view, shown in [Figure 69](#), provides an overview of buffer pool activity in the current interval. It can be invoked for one DB2 or in SSI mode for multiple DB2s; for example, a data sharing group to see member activity.

```

WI =EZDBFRPL=BFRPL===(ALL=====*)=====) 17MAR2001==12: 52: 09====M/DB2=====31

Figure 69. BFRPL View—Buffer Pool Statistics—SSI

You can use this view to review total buffer allocation and usage per pool. You can select any buffer pool to see further details.

The default functions shipped with this view are as follows:

- Sort by
  - Pool Name column (ascending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Pool Name column to BFRPLD to see threshold settings and interval and session counts for the selected buffer pool
  - Getpg/sec column to BFRPLH to see an overview of hit ratios and the most critical buffer pool activity measurements as rates per second

## BFRPLD—Local Buffer Pool Statistics Detail

The BFRPLD view, shown in [Figure 70](#), provides threshold settings and detailed local buffer pool statistics for each of these time periods:

- The current recording interval
- The current session since DB2 was started

Figure 71. BFRPLH View—Buffer Pool Rates—SSI

You can use this view to compare the most important indicators of buffer pool performance for all pools.

The default functions shipped with this view are as follows:

- Sort by
  - Pool Name column (ascending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Pool Name column to BFRPLHD to see interval and session hit ratios and counts for the selected buffer pool

## BFRPLHD—Buffer Pool Rates Detail

The BFRPLHD view, shown in [Figure 72](#), provides the most critical measurements for the selected buffer pool as hit ratios and rates per second for each of these time periods:

- The current recording interval
- The current session since DB2 was started

W1 =EZDBFRPL=BFRPLHD=(ALL=====DB2GMV54) 17MAR2001==12: 56: 06====MVDB2====D====1		
Pool Name.....	BPO	
	Interval	Sessi on
Hit Ratios.....

Data Set Opens.....	0.00	0.01

Figure 72. BFRPLHD View—Buffer Pool Rates Detail

You can use this view to determine overall activity since DB2 started and whether the current interval shows a significant deviation.

## Global Buffer Pool Views

The following views display information about global buffer pools. These are the group buffer pools defined in the coupling facility to support data sharing.

**Note:** If a group buffer pool is not currently active, it is not displayed in these views.

### GBPGSTZ—Group Buffer Pool Group Coupling Facility Status

The GBPGSTZ view, shown in [Figure 73](#), provides statistics about group buffer pool status.

```
>W1 =EZDBFRPL=GBPGSTZ=(ALL=====*) 17MAR2001==13: 00: 17====MVDB2====D====
```

Pool Name	No. Mbrs	Blocks Alloc	Dir Entries	Data Pages	Changed Pages	XI Dir Recl ai ms	Dir Recl ai ms	Data Recl ai ms

BP32K9	4	0	0	0	0	0	0	0

Figure 73. GBPGSTZ View—Group Buffer Pool Group Coupling Facility Status

You can use this view to analyze the status of all active group buffer pools from a global coupling facility viewpoint. It also shows how many DB2 members are currently connected to each pool.

The default functions shipped with this view are as follows:

- Sort by
  - Pool Name column (ascending)
- Hyperlink from
  - Pool Name column to GBPGSTD to see more detailed information about the selected buffer pool

## GBPGSTD—Group Buffer Pool Group Coupling Facility Status Detail

The GBPGSTD view, shown in [Figure 74](#), provides statistics about group buffer pool status for each of these time periods:

- The current recording interval
- The current session since DB2 was started

```

BP32K9	1	0	0	0	0	0	0	0

Figure 77. GBPREADZ View—Group Buffer Pool Read Activity Summary

You can use this view to analyze group buffer pool read activity from the viewpoint of the DB2 members. It shows synchronous and asynchronous reads caused either by buffer invalidation or because the pages were not in the local pool.

The default functions shipped with this view are as follows:

- Sort by
  - Pool Name column (ascending)
- Hyperlink from
  - Pool Name column to GBPREADM to see the counts broken out per individual DB2 member

## GBPREADM—Group Buffer Pool Read Activity

The GBPREADM view, shown in Figure 78, provides statistics about group buffer pool read activity per pool for each DB2 member currently connected to it.

```
>W1 =EZDBFRPL=GBPREADM(ALL=====*)=====) 17MAR2001==13: 07: 02====MVDB2=====31
```

Figure 87. GBPACTD View—Group Buffer Pool Activity Detail

You can use this view to see group buffer pool total activity details (reads, writes, castouts, P-Lock, coupling facility data) for one member and pool.

## Chapter 13. Page Sets

Views for page set analysis are organized into three groups:

- Page set status views
- Page set summary views
- I/O by page set views

One page set record is created for each open data set. These records provide all the available data set-related information, including the DB2 I/O counts and wait times, buffer pool cache counts, and status information.

Historical data is available for a more detailed analysis. In addition, using SSI mode with these views is very valuable for data sharing, because it allows you to see total group I/O counts per shared data set, which would otherwise be split across multiple DB2s.

You can easily access all the views for page set analysis from the Page Set Easy Menu (EZDPS), shown in [Figure 88](#).

```

WI =EZDPS===== (ALL=====*) 17MAR2001==15: 36: 55====MVDB2====D====1
                                DB2 Page Set Menu

```

Figure 88. EZDPS Easy Menu—DB2 Page Sets

Table 5 lists all the views available for page sets.

Table 5. Page Set Views

View Name	Group / Type	Description
PSAIO	I/O by Page Set Tabular	Asynchronous I/O Page Set Member Detail—Interval (see page 180)  Shows asynchronous I/O activity per page set in the last interval.  You can use this view to analyze the amount of I/O activity per page set and DB2 from one DB2.
PSAIOS	I/O by Page Set Tabular	Asynchronous I/O Page Set Member Detail—Session (see page 178)  Shows asynchronous I/O activity per page set since DB2 startup.  You can use this view to analyze the amount of I/O activity per page set and DB2 and identify I/O response time problems.
PSAIOSZ	I/O by Page Set Summary	Asynchronous I/O Page Set Summary—Session (see page 177)  Shows asynchronous I/O activity per page set since DB2 startup. If in SSI mode, data from multiple DB2 data sharing members is combined.  You can use this view to analyze the amount of I/O activity per page set and identify I/O response time problems.
PSAIOZ	I/O by Page Set Summary	Asynchronous I/O Page Set Summary—Interval (see page 179)  Shows asynchronous I/O activity per page set in the last interval. If in SSI mode, data from multiple DB2 data sharing members is combined.  You can use this view to see the current I/O workload and response times.
PSBPGBPZ	Status Summary	Buffer Pool Page Set GBP-DEP Summary (see page 162)  Summarizes group buffer pool dependent page sets and inter-DB2 interest by buffer pool and target.  You can use this view when analyzing the amount of interaction within a data sharing group.
PSBPS	Summary Tabular	Buffer Pool Page Sets—Session (see page 166)  Lists the page sets for a selected buffer pool.  You can use this view to help determine whether the access characteristics of the page set are similar and fit with the buffer pool thresholds. Scroll right to see additional data such as synchronous or asynchronous I/O.

Table 5. Page Set Views (Continued)

View Name	Group / Type	Description
PSBPSZ	Summary	Buffer Pool Page Set Summary—Session (see page 165)
	Summary	Summarizes buffer cache statistics and I/O activity by buffer pool and DB2.  You can use this view when analyzing buffer pool usage and threshold and size specifications. When in SSI mode for a data sharing group, you can identify which DB2 members are causing the most activity per buffer pool.
PSBPTMZ	Summary	Buffer Pool Page Set 2-Hour Summary (see page 167)
	Summary	Shows buffer pool activity for the last 2 hours. It is usually invoked by a hyperlink to select a specific buffer pool and DB2 target.
PSCACHE	Status	Page Set Cache (see page 158)
	Tabular	Lists all open page sets with cache statistics. You can use this view to determine virtual pool and hiperpool (scroll right) usage per page set.
PSDBSZ	Summary	Database Page Set Summary—Session (see page 168)
	Summary	Summarizes page set activity by database and DB2 target. You can use this view to evaluate I/O and cache information per database.
PSDBTMZ	Summary	Database Page Set 2-Hour Summary (see page 169)
	Summary	Shows database activity for the last 2 hours. It is usually invoked by a hyperlink to select a specific database and target.
PSDTL	Status	Page Set Detail (see page 164)
	Detail	Presents full data about the selected page set.
PSGBP	Status	Page Set GBP-DEP Status (see page 163)
	Tabular	Shows which page sets are group buffer pool dependent and the local and remote inter-DB2 interest.  You can use this view when analyzing the amount of interaction within a data sharing group.
PSLIST	Status	Page Set List (see page 159)
	Tabular	Lists all open page sets, with all data elements provided per DB2 target (scroll right).  You can use this view as the destination for various selective hyperlinks from summary views and to customize page set views.
PSLISTTZ	Status	Page Set 2-Hour Summary (see page 161)
	Summary	Shows activity for the selected page set for the last 2 hours. Additional I/O and cache information is available (scroll right).  You can use this view to evaluate page set usage patterns over time.

Table 5. Page Set Views (Continued)

View Name	Group / Type	Description
PSLISTZ	Status	Page Set List (SSI) (see page 160)
	Summary	Lists all open page sets, with all data elements provided (scroll right), summarized by page set across multiple members in a data sharing group in SSI mode.  You can use this view as the destination for various selective hyperlinks from summary views and to customize SSI page set views.
PSOBSZ	Summary	Object Page Set Summary—Session (see page 170)
	Summary	Summarizes page set activity by database object and DB2 target. You can use this view to evaluate I/O and cache information per database object.
PSOBTMZ	Summary	Object Page Set 2-Hour Summary (see page 171)
	Summary	Shows database object activity for the last 2 hours. It is usually invoked by a hyperlink to select a specific database object and target.
PSSIO	I/O by Page Set	Synchronous I/O Page Set Member Detail—Interval (see page 180)
	Tabular	Shows synchronous I/O activity per page set in the last interval.  You can use this view to analyze the amount of I/O activity per page set and DB2 from one DB2.
PSSIOS	I/O by Page Set	Synchronous I/O Page Set Member Detail—Session (see page 178)
	Tabular	Shows synchronous I/O activity per page set since DB2 startup.  You can use this view to analyze the amount of I/O activity per page set and DB2 and identify I/O response time problems.
PSSIOSZ	I/O by Page Set	Synchronous I/O Page Set Summary—Session (see page 177)
	Summary	Shows synchronous I/O activity per page set since DB2 startup. If in SSI mode, data from multiple DB2 data sharing members is combined.  You can use this view to analyze the amount of I/O activity per page set and identify I/O response time problems.
PSSIOZ	I/O by Page Set	Synchronous I/O Page Set Summary—Interval (see page 179)
	Summary	Shows synchronous I/O activity per page set in the last interval. If in SSI mode, data from multiple DB2 data sharing members is combined.  You can use this view to see the current I/O workload and response times.

Table 5. Page Set Views (Continued)

View Name	Group / Type	Description
PSSTAT	Status	Page Set Status (see page 157)
	Tabular	Lists all open page sets (table spaces, partitions, index spaces) with current status information.  You can use this view to identify size, data set utilization, and the number of extents, as well as the number of current users and pages on the deferred write queue. Hyperlinks provide more detailed status information.
PSTIO	I/O by Page Set	Total I/O Page Set Member Detail—Interval (see page 180)
	Tabular	Shows total I/O activity per page set in the last interval.  You can use this view to analyze the amount of I/O activity per page set and DB2 from one DB2.
PSTIOS	I/O by Page Set	Total I/O Page Set Member Detail—Session (see page 178)
	Tabular	Shows total I/O activity per page set since DB2 startup.  You can use this view to analyze the amount of I/O activity per page set and DB2 and identify I/O response time problems.
PSTIOSZ	I/O by Page Set	Total I/O Page Set Summary—Session (see page 177)
	Summary	Shows total I/O activity per page set since DB2 startup. If in SSI mode, data from multiple DB2 data sharing members is combined.  You can use this view to analyze the amount of I/O activity per page set and identify I/O response time problems.
PSTIOZ	I/O by Page Set	Total I/O Page Set Summary—Interval (see page 179)
	Summary	Shows total I/O activity per page set in the last interval. If in SSI mode, data from multiple DB2 data sharing members is combined.  You can use this view to see the current I/O workload and response times.
PSVOLPS	Summary	Volume Page Sets (see page 175)
	Tabular	Shows I/O activity by volume and page set per DB2.  You can use this view to analyze activity per page set on a volume.
PSVOLPSZ	Summary	Volume Page Sets (SSI) (see page 174)
	Summary	Summarizes I/O activity by volume and page sets in SSI mode.  You can use this view to analyze total activity per page set within a data sharing group.

Table 5. Page Set Views (Continued)

<b>View Name</b>	<b>Group / Type</b>	<b>Description</b>
PSVOLSSI	Summary	Volume I/O SSI Summary—Session (see page <a href="#">172</a> )
	Summary	Summarizes I/O activity by volume across multiple DB2 targets in SSI mode.  This data is especially valuable for a data sharing group to analyze total I/O.
PSVOLSZ	Summary	Volume I/O Summary—Session (see page <a href="#">173</a> )
	Summary	Summarizes I/O activity by volume and DB2.  You can use this view to analyze workload and I/O response time.
PSVOLTMZ	Summary	Volume I/O 2-Hour Summary (see page <a href="#">176</a> )
	Summary	Shows volume I/O activity over the last 2 hours. It is usually invoked by a hyperlink to select the volume.

## Page Set Status Views

The following views display information about page set status.

### PSSTAT—Page Set Status

The PSSTAT view, shown in [Figure 89](#), lists all open page sets (table spaces, partitions, index spaces) with current status information.

```

>WI =PSSTAT=====DB2G=====*=====17MAR2001==15: 29: 11====MVDB2=====37

```

Figure 89. PSSTAT View—Page Set Status

You can use this view to identify size, data set, utilization, and the number of extents, as well as the number of current users and pages on the deferred write queue. Hyperlinks provide more detailed status information.

The default functions shipped with this view are as follows:

- Sort by
  - Page Set column (ascending)
- Hyperlink from
  - Page Set column to PSDTL to see detailed information on the selected page set
  - Ty (type) column to the CLAIM analyzer display to see the claim and drain locks for the selected table space
  - Users column to the USERS analyzer display to see those threads currently accessing the selected page set
  - ERR column to the DBTS analyzer display with a Q=RESTR parameter to see whether any restricted status indicators exist for this table space
  - GBP Dep column to PSGBP to see the local and remote interest in this page set

## PSCACHE—Page Set Cache

The PSCACHE view, shown in [Figure 90](#), lists all open page sets with cache statistics.

```
>WI =PSCACHE=====DB2G=====*=====17MAR2001==15: 30: 50====MVDB2=====37

```

Figure 90. PSCACHE View—Page Set Cache

You can use this view to determine virtual pool and hiperpool (scroll right) usage per page set.

The default functions shipped with this view are as follows:

- Sort by
  - Page Set column (ascending)
- Hyperlink from
  - Page Set column to PSDTL to see detailed information on the selected page set
  - Bfrpl ID column to PSBPS to see all page sets in the selected buffer pool

## PSLIST—Page Set List

The PSLIST view, shown in [Figure 91](#), lists all open page sets, with all data elements provided per DB2 target (scroll right).

```
>W1 =PSLIST===== (ALL=====*)=====) 17MAR2001==12: 22: 13====MVDB2=====147
```

C	Page Set	Page Set	DS/	DB2	Total	Total	Max	Total	Avg

Figure 96. PSDTL View—Page Set Detail

## Page Set Summary Views

The following views summarize page set information by buffer pool, database, object, or volume.

### PSBPSZ—Buffer Pool Page Set Summary—Session

The PSBPSZ view, shown in [Figure 97](#), summarizes buffer cache statistics and I/O activity by buffer pool and DB2.

```

>W1 =PSBPSZ=====DB2G=====*=====17MAR2001==15: 35: 08====MVB2====D====1
C Bfrpl  DB2    Nr.    VP      VP      HP      Total  VP Max  VPMaxChg
-  ID    Target  PSs   Current  Changed  Current  I/Os   (1 PSet) (1 PSet)
  BP00  DB2G    37    145     0        0        39     13     2

```

Figure 97. PSBPSZ View—Buffer Pool Page Set Summary—Session

You can use this view when analyzing buffer pool usage and threshold and size specifications. When in SSI mode for a data sharing group, you can identify which DB2 members are causing the most activity per buffer pool.

The default functions shipped with this view are as follows:

- Sort by
  - Bfrpl ID column (ascending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Bfrpl ID column to PSBPS to see the page sets in that pool
  - Nr. PSs column to PSBPS to see the page sets in that pool, with only the activity from this DB2
  - VP Current column to PSBPTMZ to see activity for that buffer pool over the last two hours

## PSBPS—Buffer Pool Page Sets—Session

The PSBPS view, shown in [Figure 98](#), lists the page sets for a selected buffer pool.

```
>W1 =PSBPS=====DB2G=====*=====17MAR2001==15: 35: 55====MVDB2=====37
```

C	Bfrpl	Page Set	DB2	VP	VP	HP	Total

Figure 98. PSBPS View—Buffer Pool Page Sets—Session

You can use this view to help determine whether the access characteristics of the page set are similar and fit with the buffer pool thresholds. Scroll right to see additional data such as synchronous or asynchronous I/O.

The default functions shipped with this view are as follows:

- Sort by
  - Bfrpl ID column (ascending)
  - Page Set column (ascending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Page Set column to PSDTL to see detailed information on the selected page set

## PSBPTMZ—Buffer Pool Page Set 2-Hour Summary

The PSBPTMZ view, shown in [Figure 99](#), shows buffer pool activity for the last 2 hours. It is usually invoked by a hyperlink to select a specific buffer pool and DB2 target.

```
>H1 =PSBPTMZ=====DB2GMV54=*=====17MAR2001==12: 51=96M===MVDB2====D====7
```

C Bfrpl	Time	DB2	No.	VP	VP	HP	Total	I/O	Syn
- ID	Intvl	Target	PSs	Current	Changed	Current	I/Os	%	I/O
BP00	12: 51	DB2GMV54	81	148	37	198	23	79.3	1
BP00	12: 45	DB2GMV54	77	181	32	191	6	20.7	
BP00	12: 30	DB2GMV54	35	130	0	0	0	0.0	
BP00	12: 15	DB2GMV54	35	130	0	0	0	0.0	
BP00	12: 00	DB2GMV54	35	130	0	0	0	0.0	
BP00	11: 45	DB2GMV54	35	130	0	0	0	0.0	
BP00	11: 30	DB2GMV54	35	130	0	0	0	0.0	

Figure 99. PSBPTMZ View—Buffer Pool Page Set 2-Hour Summary

The default functions shipped with this view are as follows:

- Sort by
  - Bfrpl ID column (ascending)
  - Time Intvl column (descending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Bfrpl ID column to PSBPS to see page set activity for the selected buffer pool in that history interval

## PSDBSZ—Database Page Set Summary—Session

The PSDBSZ view, shown in [Figure 100](#), summarizes page set activity by database and DB2 target.

+W1 =PSDBSZ=====DB2G=====*=====17MAR2001==15: 37: 22====MVDB2====D====5									
C	Page Set	DB2	Nr.	Total	I/O	Sync	Async	VP

	DSN8D41A	DB2G	4	5	12.8	16	1	2	15

Figure 100. PSDBSZ View—Database Page Set Summary—Session

You can use this view to evaluate I/O and cache information per database.

The default functions shipped with this view are as follows:

- Sort by
  - Page Set / Database column (ascending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Page Set / Database column to PSLISTZ to see the page set activity in this database (or summarized for the group if in SSI mode)
  - Nr. PSs column to PSLIST to see page set activity in the database for this DB2
  - Total I/Os column to PSDBTMZ to see activity for the selected database over the last two hours

## PSDBTMZ—Database Page Set 2-Hour Summary

The PSDBTMZ view, shown in [Figure 101](#), shows database activity for the last 2 hours. It is usually invoked by a hyperlink to select a specific database and target.

```
>H1 =PSDBTMZ=====DB2GMV54=*=====17MAR2001==12: 58=103M==MVDB2====D====7
```

C	Page Set	Time	DB2	No.	Total	I/O	Sync	Async	Async	VP

Figure 108. PSVOLTMZ View—Volume I/O 2-Hour Summary

The default functions shipped with this view are as follows:

- Sort by
  - Volume column (ascending)
  - Time Intvl column (descending)
  - DB2 Target column (ascending)

## I/O by Page Set Views

The following views display information about I/O by page set.

### PSxIOSZ—I/O Page Set Summary—Session

The PSxIOSZ views, as shown in [Figure 109](#), show I/O activity per page set since DB2 startup for each of these categories:

- Synchronous I/O
- Asynchronous I/O
- Total I/O

If in SSI mode, data from multiple DB2 data sharing members is combined.

```

Figure 109. PSSIOSZ View—I/O Page Set Summary—Session

You can use these views to analyze the amount of I/O activity per page set and identify I/O response time problems.

There are three similar views that present the data for either synchronous, asynchronous, or total I/O:

- PSSIOSZ—Synchronous I/O
- PSAIOSZ—Asynchronous I/O
- PSTIOSZ—Total I/O

The default functions shipped with these views are as follows:

- Sort by
  - Page Set column (ascending)
- Hyperlink from
  - Page Set column to PSxIOS to see I/O activity per DB2 (in SSI mode)

## PSxIOS—I/O Page Set Member Detail—Session

The PSxIOS views, as shown in [Figure 110](#), show I/O activity per page set since DB2 startup for each of these categories:

- Synchronous I/O
- Asynchronous I/O
- Total I/O

```

W1 =PSSIOS=====DB2G=====*=====17MAR2001==15: 53: 54====MVDB2=====37

Figure 110. PSSIOS View—I/O Page Set Member Detail—Session

You can use these views to analyze the amount of I/O activity per page set and DB2 and identify I/O response time problems.

There are three similar views that present the data for either synchronous, asynchronous, or total I/O:

- PSSIOS—Synchronous I/O
- PSAIOS—Asynchronous I/O
- PSTIOS—Total I/O

The default functions shipped with these views are as follows:

- Sort by
  - Page Set column (ascending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Page Set column to PSDTL to see detailed information on the selected page set

## PSxIOZ—I/O Page Set Summary—Interval

The PSxIOZ views, as shown in [Figure 111](#), show I/O activity per page set in the last interval for each of these categories:

- Synchronous I/O
- Asynchronous I/O
- Total I/O

If in SSI mode, data from multiple DB2 data sharing members is combined.

```

>W1 =PSSIOZ=====DB2G=====*=====17MAR2001==15: 54: 35====MVB2=====37

```

Figure 111. PSSIOZ View—I/O Page Set Summary—Interval

You can use these views to see the current I/O workload and response times.

There are three similar views that present the data for either synchronous, asynchronous, or total I/O:

- PSSIOZ—Synchronous I/O
- PSAIOZ—Asynchronous I/O
- PSTIOZ—Total I/O

The default functions shipped with these views are as follows:

- Sort by
  - Page Set column (ascending)
- Hyperlink from
  - Page Set column to PSxIO to see I/O activity in the last interval for the selected page set

## PSxIO—I/O Page Set Member Detail—Interval

The PSxIO views, as shown in [Figure 112](#), show I/O activity per page set in the last interval for each of these categories:

- Synchronous I/O
- Asynchronous I/O
- Total I/O

WI =PSSIO=====DB2=====17MAR2001==15: 55: 23====MADB2=====37

Figure 112. PSSIO View—I/O Page Set Member Detail—Interval

You can use these views to analyze the amount of I/O activity per page set and DB2 from one DB2.

There are three similar views that present the data for either synchronous, asynchronous, or total I/O:

- PSSIO—Synchronous I/O
- PSAIO—Asynchronous I/O
- PSTIO—Total I/O

The default functions shipped with these views are as follows:

- Sort by
  - Page Set column (ascending)
  - DB2 Target column (ascending)
- Hyperlink from
  - Page Set column to PSDTL to see detailed information on the selected page set

## Chapter 14. Threads

Views for thread analysis are organized into two groups:

- Thread summary views
- Thread detail views

One thread record is created for each active thread. These records provide the most important indicators of current thread activity.

Using SSI mode with these views allows the threads from multiple DB2s to be shown together in one display. This ability is especially important in a sysplex where incoming work may be processed in any of several different systems and it can be difficult to locate a particular user.

Table 6 lists all the views available for threads.

Table 6. Thread Views

View Name	Group / Type	Description
THDACTV	Detail	All Active Threads (see page 190)
	Tabular	Displays information about each active thread.
THDALL	Detail	All Connected Threads (see page 191)
	Tabular	Displays information about each connected thread.
THDCICPR	Detail	CICS Protected Thread Averages (see page 193)
	Tabular	Displays information about CICS protected threads.  You can use this view to see average counts and times across the multiple CICS transactions executed under a single protected thread.
THDCONNZ	Summary	Thread Summary by Connection (see page 184)
	Summary	Summarizes current thread activity by connection name.  You can use this view to see an overview of current activity by the source of each workload, such as CICS, IMS, batch, or TSO connections. In SSI mode, it shows the total workload in the defined context. This can be especially valuable in a data sharing sysplex.
THDCTYPZ	Summary	Thread Summary by Connection Type (see page 185)
	Summary	Summarizes current thread activity by connection type.  You can use this view to see an overview of current activity by attach type, such as CICS, TSO, IMS-MPP, or IMS-BMP. In SSI mode, it shows the total workload in the defined context. This can be especially valuable in a data sharing sysplex.

Table 6. Thread Views (Continued)

View Name	Group / Type	Description
THDDB2Z	Summary	Thread Summary by DB2 ID (see page 186)
	Summary	Summarizes current thread activity by the target DB2 subsystem ID.  You can use this view to see an overview of current activity for each DB2 in the defined context.
THDDETL	Detail	Thread Detail (see page 195)
	Detail	Shows detailed information about the selected user.  You can use this view to view all collected information for a thread. Additional information is available through the alternative hyperlinks to the DUSER display.
THDLIST	Detail	All Active Threads—Long Form (see page 192)
	Tabular	Displays information about each active thread.  You can use this view to customize one or more views with exactly the data you want to see for your workload(s).
THDPLANZ	Summary	Thread Summary by Plan Name (see page 187)
	Summary	Summarizes current thread activity by plan name.  You can use this view to see an overview of current activity by application. In SSI mode, it shows the total workload in the defined context. This can be especially valuable in a data sharing sysplex.
THDPRLLD	Detail	Parallel Query Detail (see page 194)
	Tabular	Shows each active task of a parallel query.  You can use this view to understand the total scope of a parallel query. In a data sharing group context, it shows all parallel tasks running in multiple DB2 members with sysplex query parallelism.
THDPRL LZ	Summary	Summary of Parallel Queries (see page 188)
	Summary	Summarizes all queries that have invoked the parallel processing feature.  You can use this view to see an overview of all parallel queries currently active in the defined context. In a data sharing group, it includes all parallel tasks running with sysplex query parallelism.
THDUSERZ	Summary	Thread Summary by User ID (see page 189)
	Summary	Summarizes current thread activity by user ID.  You can use this view to see an overview of current activity by user ID and DB2. This is useful mainly for sources of multiple threads like CICS or the DB2 internal threads labeled SYSOPR.

Table 6. Thread Views (Continued)

View Name	Group / Type	Description
THDWARN	Detail	Key Indicator/Warnings (see page <a href="#">197</a> )
	Tabular	<p>Provides information about the most important key indicators of failures or degradation.</p> <p>You can use this view to see if the selected threads have more than one warning indicator set. A hyperlink on the Indicator Msg column shows more information on these warnings.</p>
THDWARND	Detail	Key Indicator/Warnings Detail (see page <a href="#">198</a> )
	Detail	<p>Displays detailed information about key indicator warning messages for the selected user.</p> <p>You can use this view to analyze threads that have more than one warning.</p>

## Thread Summary Views

The following views display summary information about all active threads.

### THDCONNZ—Thread Summary by Connection

The THDCONNZ view, shown in [Figure 113](#), summarizes current thread activity by connection name.

W1 =THDCONNZ=====DB2G=====*=====17MAR2001==13: 48: 31====MVDB2====D====5										
Connect Name	Threads Connect	Threads in Plan	Active in DB2	Thds Susp	Average Elapsed	Warn	SQL Rate	Locks	Getpg	Rate
CICSCN4	14	2	0	0	00:00:00.00	Yes	0	7	0	0
CICS41C3	27	1	0	0	00:00:00.00	No	0	4	0	0
DB2CALL	13	4	8	0	00:45:22.26	No	0	0	0	0
SYSTEM	91	0	91	76	00:00:00.00	Yes	0	4	0	0
X18H	2	0	0	0	00:00:00.00	No	0	0	0	0

Figure 113. THDCONNZ View—Thread Summary by Connection

You can use this view to see an overview of current activity by the source of each workload, such as CICS, IMS, batch, or TSO connections. In SSI mode, it shows the total workload in the defined context. This can be especially valuable in a data sharing sysplex.

The default functions shipped with this view are as follows:

- Sort by
  - Connect Name column (ascending)
- Hyperlink from
  - Connect Name column to THDCICPR to see information about CICS protected threads when connection type equals CICS and a protected thread has been reused
  - Threads Connect column to THDALL to see all connected threads for the selected connection in the defined context
  - Threads in Plan column to THDACTV to see all active threads for the selected connection in the defined context
  - Warn column to THDWARN to see information about the key indicators of failures or degradation for the selected connection
  - Locks column to LOCKU analyzer display to see a summary of lock contention by user if any locks are held by threads of this connection

## THDCTYPZ—Thread Summary by Connection Type

The THDCTYPZ view, shown in [Figure 114](#), summarizes current thread activity by connection type.

Connect Type	Threads Connect	Threads in Plan	Active in DB2	Thrds Susp	Average Elapsed	Warn	SQL Rate	Locks	Getpg Rate
DB2CALL	13	4	8	0	01:46:42.36	No	0	0	0
SYSTEM	112	0	112	97	00:00:00.00	No	0	2	0

Figure 114. THDCTYPZ View—Thread Summary by Connection Type

You can use this view to see an overview of current activity by attach type, such as CICS, TSO, IMS-MPP, or IMS-BMP. In SSI mode, it shows the total workload in the defined context. This can be especially valuable in a data sharing sysplex.

The default functions shipped with this view are as follows:

- Sort by
  - Connect Type column (ascending)
- Hyperlink from
  - Connect Type column to THDCICPR to see information about CICS protected threads when connection type equals CICS and a protected thread has been reused
  - Threads Connect column to THDALL to see all connected threads for the selected connection in the defined context
  - Threads in Plan column to THDACTV to see all active threads for the selected connection in the defined context
  - Warn column to THDWARN to see information about the key indicators of failures or degradation for the selected connection
  - Locks column to LOCKU analyzer display to see a summary of lock contention by user if any locks are held by threads of this connection type

## THDDB2Z—Thread Summary by DB2 ID

The THDDB2Z view, shown in [Figure 115](#), summarizes current thread activity by the target DB2 subsystem ID.

W1 =THDDB2Z=====DB2G=====*=====17MAR2001==17: 57: 08====M/DB2====D====1										
DB2	MVS	Threads Connect	Threads in Plan	Active Thrds in DB2	Susp	Average Elapsed	Warn	SQL Rate	Locks	Getpg Rate
DB2G	SYSD	54	2	38	0	00: 15: 35. 16	No	0	1	0

Figure 115. THDDB2Z View—Thread Summary by DB2 ID

You can use this view to see an overview of current activity for each DB2 in the defined context.

The default functions shipped with this view are as follows:

- Sort by
  - DB2 column (ascending)
- Hyperlink from
  - Threads Connect column to THDALL to see all connected threads for the selected DB2 in the defined context
  - Threads in Plan column to THDACTV to see all active threads for the selected DB2 in the defined context
  - Warn column to THDWARN to see information about the key indicators of failures or degradation for the selected DB2
  - Locks column to LOCKU analyzer display to see a summary of lock contention by user if any locks are held by threads of this DB2

## THDPLANZ—Thread Summary by Plan Name

The THDPLANZ view, shown in [Figure 116](#), summarizes current thread activity by plan name.

```
>WI =THDPLANZ=====DB2G=====*=====17MAR2001==14: 31: 48====MVDB2====D====7
```

Plan	Threads Connect	Threads in Plan	Active in DB2	Thds Susp	Average Elapsed	In DB2 Elapsed	Warn	SQL Rate
- noname-	52	3	8	0	00:13:26.59	00:00:00.12	No	0
DB2GDBM1	68	0	68	66	00:00:00.00	00:00:00.00	Yes	0
DB2GDI ST	6	0	6	4	00:00:00.00	00:00:00.00	Yes	0
DB2GMSTR	17	0	17	6	00:00:00.00	00:00:00.00	Yes	0
DSN8CCO	1	1	0	0	00:00:00.00	00:00:00.00	No	0
TSMCOM3	1	1	0	0	00:00:00.00	00:00:00.00	No	0
TSMPL08	1	1	0	0	00:00:00.00	00:00:00.00	Yes	0

Figure 116. THDPLANZ View—Thread Summary by Plan Name

You can use this view to see an overview of current activity by application. In SSI mode, it shows the total workload in the defined context. This can be especially valuable in a data sharing sysplex.

The default functions shipped with this view are as follows:

- Sort by
  - Plan column (ascending)
- Hyperlink from
  - Plan column to THDCICPR to see information about CICS protected threads when connection type equals CICS and a protected thread has been reused
  - Threads Connect column to THDALL to see all connected threads for the selected plan in the defined context
  - Threads in Plan column to THDACTV to see all active threads for the selected plan in the defined context
  - Warn column to THDWARN to see information about the key indicators of failures or degradation for the selected plan
  - Locks column to LOCKU analyzer display to see a summary of lock contention by user if any locks are held by execution of this plan

## THDPRLZ—Summary of Parallel Queries

The THDPRLZ view, shown in [Figure 117](#), summarizes all queries that have invoked the parallel processing feature.

W1 =THDPRLZ=====DBGG=====17MAR2001==13: 48: 31====MVDB2====D====5								
Query Nr.	User ID	Totl Connect Task Name	CPU Time	Average El apsed	SQL Stmts	Locks	Getpg Total	
1	ACCTDEP	2 CICSCN4	00: 00: 01. 32	00: 01: 40. 09	2	0	0	
2	BOLHHH4	4 TSO	00: 00: 00. 79	00: 00: 55. 36	1	10	25312	

Figure 117. THDPRLZ View—Summary of Parallel Queries

You can use this view to see an overview of all parallel queries currently active in the defined context. In a data sharing group, it includes all parallel tasks running with sysplex query parallelism.

The default functions shipped with this view are as follows:

- Sort by
  - Query Nr. column (ascending)
- Hyperlink from
  - Query Nr. column to THDPRLD to see detailed information about each task of a parallel query

## THDUSERZ—Thread Summary by User ID

The THDUSERZ view, shown in [Figure 118](#), summarizes current thread activity by user ID.

W1 =THDUSERZ=====DB2G=====17MAR2001==17: 58: 32====MADB2=====19										
User ID	DB2	Totl	Connect Name	CPU Time	Average Elapsed	%CPU	SQL Stmt s	Locks	Getpg	Total

Figure 118. THDUSERZ View—Thread Summary by User ID

You can use this view to see an overview of current activity by user ID and DB2. This is useful mainly for sources of multiple threads like CICS or the DB2 internal threads labeled SYSOPR.

The default functions shipped with this view are as follows:

- Sort by
  - User ID column (ascending)
  - DB2 column (ascending)
- Hyperlink from
  - DB2 column to THDACTV to see all active threads for the selected DB2 and user ID
  - Locks column to LOCKU analyzer display to see a summary of lock contention by user if any locks are held by threads from this user ID

## Thread Detail Views

The following views display detailed information about each active thread.

### THDACTV—All Active Threads

The THDACTV view, shown in [Figure 119](#), displays information about each active thread.

```
>W1 =THDACTV=====DB2G=====*=====17MAR2001==13: 53: 53====MVDB2====D====7
```

Auth ID	ID	Connect Name	CPU Time	El apsed Time	%CPU	SQL Stmts	Warn	Locks	User
ACCTDEP	DB2G	CICSCN4	00: 00: 00. 00	00: 00: 00. 00	0. 0	2	No	3	ACTIV
BOLHHH2	DB2G	DB2CALL	00: 00: 03. 04	00: 32: 46. 08	0. 0	0	No	0	BBI M
DMRA	DB2G	DB2CALL	00: 00: 16. 58	02: 43: 50. 40	0. 0	0	No	0	BBI M
DSN8410	DB2G	CICS41C3	00: 00: 00. 00	00: 00: 00. 00	0. 0	1	No	4	ACTIV
OLTR	DB2G	DB2CALL	00: 00: 06. 72	01: 05: 32. 16	0. 0	0	No	0	BBI M
TSGSTC	DB2G	DB2CALL	00: 00: 36. 88	06: 11: 22. 24	0. 0	0	No	0	BBI M
TSMB	DB2G	CICSCN4	00: 00: 00. 00	00: 00: 00. 00	0. 0	348	Yes	4	ACTIV

Figure 119. THDACTV View—All Active Threads

The default functions shipped with this view are as follows:

- Hyperlink from
  - Auth ID column to DUSER analyzer display to see detailed information about the selected user in each of these categories:
    - Status
    - Environmental indicators
    - Elapsed time analysis
    - SQL statement execution counts
    - Buffer pool activity
    - Lock activity
    - Parallelism
    - DDF activity
    - Stored procedures
  - Connect Name column to THDCICPR to see information about CICS protected threads when connection type equals CICS and a protected thread has been reused
  - Warn column to THDWARND to see details about key indicator warning messages for the selected user
  - Locks column to LOCKE analyzer display to see lock contention by user details if this thread is holding locks
  - User Status column to THDDETL to see more detailed information about the selected user

## THDALL—All Connected Threads

The THDALL view, shown in [Figure 120](#), displays information about each connected thread.

```
>WI =THDALL=====DB2G=====*=====17MAR2001==12: 28: 56====MVDB2=====120
```

User ID	DB2	Connect Name	CPU Time	Elapsed Time	%CPU	User Status	SQL	Stmts	Warn

Figure 120. THDALL View—All Connected Threads

The default functions shipped with this view are as follows:

- Sort by
  - User ID column (ascending)
  - DB2 column (ascending)
- Hyperlink from
  - User ID column to DUSER analyzer display to see detailed information about the selected user in each of these categories:
    - Status
    - Environmental indicators
    - Elapsed time analysis
    - SQL statement execution counts
    - Buffer pool activity
    - Lock activity
    - Parallelism
    - DDF activity
    - Stored procedures
  - DB2 column to THDACTV to see all active threads for the selected target
  - Connect Name column to THDCICPR to see information about CICS protected threads when connection type equals CICS and a protected thread has been reused
  - User Status column to THDDETL to see more detailed information about the selected user
  - Warn column to THDWARND to see details about key indicator warning messages for the selected user
  - Lock column to LOCKE analyzer display to see lock contention by user details if this user is holding locks

## THDLIST—All Active Threads—Long Form

The THDLIST view, shown in [Figure 121](#), displays information about each active thread.

```

>WI =THDLIST=====DB2G=====*=====17MAR2001==12: 05: 10====M\DB2=====120

```

Figure 121. THDLIST View—All Active Threads—Long Form

You can use this view to customize one or more views with exactly the data you want to see for your workload(s).

The default functions shipped with this view are as follows:

- Sort by
  - User ID column (ascending)
  - DB2 column (ascending)
- Hyperlink from
  - User ID column to DUSER analyzer display to see detailed information about the selected user in each of these categories:
    - Status
    - Environmental indicators
    - Elapsed time analysis
    - SQL statement execution counts
    - Buffer pool activity
    - Lock activity
    - Parallelism
    - DDF activity
    - Stored procedures
  - Warn column to THDWARND to see details about key indicator warning messages for the selected user
  - User Status column to THDDETL to see more detailed information about the selected user

- Locks column to LOCKE analyzer display to see lock contention by user details if this thread is holding locks

## THDCICPR—CICS Protected Thread Averages

The THDCICPR view, shown in [Figure 122](#), displays information about CICS protected threads.

```
>WI =THDCICPR=====DB2G=====17MAR2001==13: 53: 53====MVB2====D====3
```

Auth ID	Nr.	CICS Tran Name	Average CPU Time	Average Elapsed	Average SQL	Average Getpages	Average SyncRead
ACCTDEP	10	CICSCN4	00:00:00.00	00:00:01.02	2	325	112
DSN8410	1	CICS41C3	00:00:02.65	00:00:30.09	1	10	2
TSM8	3	CICSCN4	00:00:00.00	00:00:05.15	348	7923	821

Figure 122. THDCICPR View—CICS Protected Thread Averages

You can use this view to see average counts and times across the multiple CICS transactions executed under a single protected thread.

The default functions shipped with this view are as follows:

- Sort by
  - Auth ID column (ascending)
- Hyperlink from
  - Auth ID column to THDDETL to see more detailed information about the selected user
  - CICS Name column to THDACTV to see all active threads for the selected CICS system in the defined context

## THDPRLLD—Parallel Query Detail

The THDPRLLD view, shown in [Figure 123](#), shows each active task of a parallel query.

W1 =THDPRLD=====DBGG=====17MAR2001==13: 48: 43====MVDB2====D====5								
User ID	DB2	Connect Name	CPU Time	Getpage Total	SQL Stmt s	Warn	Task Type	User Status
BOLHHH4	DB2G	TSO	00: 00: 00. 08	255	4	No	Coord	ACTIVE- DB2
BOLHHH4	DB0G	TSO	00: 00: 00. 01	17	0	No	Assi st	IRLM
BOLHHH4	DB1G	TSO	00: 00: 00. 63	25109	0	No	Assi st	ACTIVE- DB2
BOLHHH4	DB2G	TSO	00: 00: 00. 23	5989	0	No	Assi st	ACTIVE- DB2

Figure 123. THDPRLLD View—Parallel Query Detail

You can use this view to understand the total scope of a parallel query. In a data sharing group context, it shows all parallel tasks running in multiple DB2 members with sysplex query parallelism.

The default functions shipped with this view are as follows:

- Hyperlink from
  - User ID column to DUSER to see more detailed information about the selected user

## THDDETL—Thread Detail

The THDDETL view, shown in [Figure 124](#), shows detailed information about the selected user.

```

Figure 124. THDDETL View—Thread Detail

You can use this view to view all collected information for a thread. Additional information is available through the alternative hyperlinks to the DUSER display.

## Threads

The default functions shipped with this view are as follows:

- Hyperlink from
  - Primary User ID column to DUSER analyzer display to see detailed information about the selected user in each of these categories:
    - Status
    - Environmental indicators
    - Elapsed time analysis
    - SQL statement execution counts
    - Buffer pool activity
    - Lock activity
    - Parallelism
    - DDF activity
    - Stored procedures
  - Warn Indicators and User Status columns to THDWARND to see more information on all warning indicators
  - Locks column to LOCKE analyzer display to see lock contention by user details if this thread is holding locks

## THDWARN—Key Indicator/Warnings

The THDWARN view, shown in [Figure 125](#), provides information about the most important key indicators of failures or degradation.

```

>W1 =THDWARN=====DB2H=====*=====17MAR2001==13: 30: 40====MVDB2=====47

```

User ID	DB2	Plan Name	User Status	Indicator	Msg	Ind 1	Ind 2	Ind 3	Ind 4	Ind 5	Ind 6

Figure 125. THDWARN View—Key Indicator/Warnings

You can use this view to see if the selected threads have more than one warning indicator set. A hyperlink on the Indicator Msg column shows more information on these warnings.

The default functions shipped with this view are as follows:

- Hyperlink from
  - User ID column to DUSER analyzer display to see detailed information about the selected user in each of these categories:
    - Status
    - Environmental indicators
    - Elapsed time analysis
    - SQL statement execution counts
    - Buffer pool activity
    - Lock activity
    - Parallelism
    - DDF activity
    - Stored procedures
  - User Status column to THDDETL to see more detailed information about the selected user
  - Indicator Msg column to THDWARND to see more information on all warning indicators

## THDWARND—Key Indicator/Warnings Detail

The THDWARND view, shown in Figure 126, displays detailed information about key indicator warning messages for the selected user.

W1 =THDWARND=THDWARND=DB2G=====17MAR2001==12: 50: 45====MVDB2====D====1	
User's Authorization ID.....	TSTUSER1
DB2 Subsystem Name.....	DB2G

User State Flag 1.....	82
User State Flag 2.....	20
VTAM State Flag.....	80

Figure 126. THDWARND View—Key Indicator/Warnings Detail

You can use this view to analyze threads that have more than one warning.

The default functions shipped with this view are as follows:

- Hyperlink from
  - User's Authorization ID column to DUSER analyzer display to see detailed information about the selected user in each of these categories:
    - Status
    - Environmental indicators
    - Elapsed time analysis
    - SQL statement execution counts
    - Buffer pool activity
    - Lock activity
    - Parallelism
    - DDF activity
    - Stored procedures
  - Indicator Message and Current Task Status columns to THDDETL to see more detailed information

---

## Chapter 15. Workloads

Views for workload analysis are grouped into a single category:

- Workload objective views

The workload objective views show the response or elapsed time performance of DB2 transactions that occur within workloads defined as part of a MAINVIEW for DB2 workload. Workloads are ranked according to the percentage of transactions that are completed in less time than the response time objective defined for the workload.

You can use these views to see how well MAINVIEW for DB2 workloads are meeting their defined response time objectives.

Table 7 lists all the views available for workloads.

Table 7. Workload Views

View Name	Group / Type	Description
DOBJ	Objective	Objectives Review—Interval (see page 201)
	Tabular	Shows a workload's transaction performance for each target DB2 subsystem for the current interval.
DOBJR	Objective	Objectives Review—Realtime (see page 201)
	Tabular	Shows a workload's transaction performance for each target DB2 subsystem for the current realtime period.
DOBJRZ	Objective	Objective Summary—Realtime (see page 202)
	Summary	Summarizes workload performance across all DB2 subsystems in the current context for the current realtime period.
DOBJS	Objective	Objectives Review—Session (see page 201)
	Tabular	Shows a workload's transaction performance for each target DB2 subsystem for the current session since DB2 was started.
DOBJSZ	Objective	Objective Summary—Session (see page 202)
	Summary	Summarizes workload performance across all DB2 subsystems in the current context for the current session since DB2 was started.
DOBJZ	Objective	Objective Summary—Interval (see page 202)
	Summary	Summarizes workload performance across all DB2 subsystems in the current context for the current interval.

## Workload Objective Views

The following views display information about workload objectives.

### DOBJ—Objectives Review

The Objectives Review views, as shown in [Figure 127](#), show a workload's transaction performance for each target DB2 subsystem.

W1 =DOBJ=====DB2G=====*=*****=17MAR2001==14: 49: 33====MVDB2====D====1										
CMD	Workload	% <=	Resp	Goal	Resp	Goal	Avg	Tran	Composite	Target
---	Name----	0. ....	50. ...	100	Goal -	%	Resp---	Count	Workload-	-----
	ALLWORK	95.6			1.00	95	0.843	125	SAMPLE	DB2G
	ALLWORK	66.7			1.00	95	1.428	167	SAMPLE	DB1G

Figure 127. DOBJ View—Objectives Review

There are three similar views that present the data from different time periods:

- DOBJ—Interval
- DOBJR—Realtime
- DOBJS—Session

The default functions shipped with these views are as follows:

- Hyperlink from
  - Workload Name column to DWKLDDET to see the current values of the definition for that workload
  - % Resp Goal column to D@ELTD plot view to see a graph of DB2 elapsed time values for this workload

## DOBJZ—Objective Summary

The Objective Summary views, as shown in [Figure 128](#), summarize workload performance across all DB2 subsystems in the current context.

W1 =DOBJZ=====DB2G=====*=====17MAR2001==11: 31: 55====MVDB2====D====1									
CMD	Workl oad	% <=	Resp	Goal	Resp	Goal	Avg	Tran	Composit e
---	Name----	0. . . . .	50. . .	100	Goal -	%	Resp---	Count	Workl oad-
	ALLWORK	92.3			1.00	95	0.892	1417	SAMPLE
									Wkl ds---
									2

Figure 128. DOBJZ View—Objective Summary

There are three similar views that present the data from different time periods:

- DOBJZ—Interval
- DOBJRZ—Realtime
- DOBJSZ—Session

The default functions shipped with these views are as follows:

- Hyperlink from
  - Workload Name column to DOBJ to see the data for each target

---

## Chapter 16. Lockouts

Views for lock contention analysis based on timeout and deadlock events are organized into three groups:

- Lockout event views
- Resource conflict views
- Involved thread views (victims, blockers, waiters)

Lockout records are created per resource involved in a lockout (usually just one for a timeout, but two or more for a deadlock). This enables views by resource, blocker, and waiter, not just the lockout events and the victim identifiers. Each record is marked as having the victim as the waiter or blocker, or only containing participants in a deadlock. Lockout event-related views select only those records where the victim is the waiter, whereas resource or waiter/blocker views select all records.

MAINVIEW for DB2 automatically captures the DB2 IFCIDs 172 (deadlocks) and 196 (timeouts) to collect this data. The records are written to history as they occur and can be retrieved by TIME period. If no TIME is specified, the latest events still in the active LKOUT buffer (default of 100) are shown. The default can be adjusted with the LOCKOUTS parameter in the DMRBEX00 BBPARM member.

**Note:** Instead of *holder*, the term *blocker* is used, since a priority waiter or a retained lock also can block a resource and cause lockouts.

Table 8 lists all the views available for lockouts.

Table 8. Lockout Views

View Name	Group / Type	Description
LKBLOCK	Thread Detail	Lockout Blocker Plan Detail (see page 217)  Lists all conflicts by blocker plan and timestamp.  You can use this view to identify all specific conflicts caused by a plan over time.
LKBLOCKZ	Thread Summary	Lockout Blocker Plan Summary (see page 216)  Summarizes conflicts by blocker IDs.  You can use this view to analyze plans and users causing lockouts.
LKBWZ	Thread Summary	Lockout Blocker/Waiter Summary (see page 215)  Lists a summary of blocker / waiter plans.  You can use this view to identify conflicting plans.
LKBWZSSI	Thread Summary	Lockout Global Blocker/Waiter Summary (see page 214)  Lists a summary of blocker / waiter plans and systems.  You can use this view to identify conflicting plans across multiple data sharing DB2 members.
LKCONZ	Thread Summary	Lockout Connection Summary (see page 213)  Lists a summary of lockout victims by connection type.  You can use this view to identify scheduling problems with incompatible workloads (for example, IMS/CICS transactions blocked by batch).
LKEVD	Event Detail	Lockout Event Resource Detail (see page 209)  Provides full data about the selected resource conflict.
LKEVENT	Event Tabular	Lockout Events (see page 206)  Lists the latest timeout (IFCID 196) or deadlock (IFCID 172) events that have occurred in this DB2.
LKEVRES	Event Tabular	Lockout Event Resources (see page 208)  Lists each resource involved in the selected lockout.
LKEVSSI	Event Tabular	Global Lockout Events (see page 207)  Lists lockout events within a data sharing group.

Table 8. Lockout Views (Continued)

View Name	Group / Type	Description
LKRESD	Event	Lockout Resource Conflict Detail (see page 212)
	Tabular	Lists each occurrence by time of any lockout where the selected resource (database / table space or specific page) was involved.  You can use this view to identify all plans involved in conflicts on this resource and help identify potential application scheduling problems.
LKRESNRZ	Resource	Lockout Resource Number Summary (see page 211)
	Summary	Lists each page / row involved in any conflict, usually for a selected resource (database / table space) from LKRESZ.  You can use this view to see the hot spots in a table by identifying the pages hit.
LKRESZ	Resource	Lockout Resource Summary (see page 210)
	Summary	Lists each resource (database / table space) involved in any conflict.  You can use this view to see which table spaces cause the most conflicts.
LKWAIT	Thread	Lockout Waiter Plan Detail (see page 219)
	Detail	Lists all conflicts by waiter plan and timestamp.  You can use this view to identify all specific conflicts over time where a plan was a waiter.
LKWAITZ	Thread	Lockout Waiter Plan Summary (see page 218)
	Summary	Lists conflicts by waiter IDs.  You can use this view to analyze plans and users suffering most from lockouts.

## Lockout Event Views

The following views display information about lockout events.

### LKEVENT—Lockout Events

The LKEVENT view, shown in [Figure 129](#), lists the latest timeout (IFCID 196) or deadlock (IFCID 172) events that have occurred in this DB2.

```
>W1 =LKEVENT=====DB2G=====*=====17MAR2001==16: 31: 07====MVDB2====D====5
```

Date / Time	Lockout Type	Victim Plan	Victim AuthID	Victim Connect	Victim CType	Victim Corr ID	Nr. Res.
17MAR- 15: 27: 45	DEADLOCK	RXDB2	BOLJGQ2	DB2CALL	CAF	BOLJGQ2	2
17MAR- 15: 19: 24	TIMEOUT	RXDB2	BOLJGQ3	DB2CALL	CAF	BOLJGQ3	1
17MAR- 15: 10: 43	TIMEOUT	RXDB2	BOLJGQ3	DB2CALL	CAF	BOLJGQ3	1
17MAR- 15: 00: 10	TIMEOUT	RXDB2	BOLJGQ2	DB2CALL	CAF	BOLJGQ2	1
17MAR- 14: 59: 01	TIMEOUT	RXDB2	BOLJGQ2	DB2CALL	CAF	BOLJGQ2	1

Figure 129. LKEVENT View—Lockout Events

The default functions shipped with this view are as follows:

- Sort by
  - Date / Time column (descending)
- Hyperlink from
  - Date / Time column to LKEVRES to see the resources involved
  - Victim Plan column to LKWAIT to see other events where this plan was a waiter

## LKEVSSI—Global Lockout Events

The LKEVSSI view, shown in [Figure 130](#), lists lockout events within a data sharing group.

```
>WI =LKEVSSI===== (DBGG=====*)=====) 17MAR2001==11: 00: 44====MVDDB2====D====9
```

Date / Time	Lockout Type	Victim Member	Victim Plan	Victim AuthID	Victim Connect	Victim CorrName	Global Cont.
17MAR- 10: 46: 11	TIMEOUT	DB1G	RXDB2	BOLJGQ2	DB2CALL	BOLJGQ2	YES
17MAR- 10: 44: 09	DEADLOCK	DB2G	RXDB2	BOLJGQ1	DB2CALL	BOLJGQ1	YES
17MAR- 10: 42: 41	TIMEOUT	DB1G	RXDB2	BOLJGQ2	DB2CALL	BOLJGQ2	
17MAR- 10: 40: 39	DEADLOCK	DB2G	RXDB2	BOLJGQ1	DB2CALL	BOLJGQ1	YES
17MAR- 10: 39: 59	DEADLOCK	DB2G	RXDB2	BOLJGQ1	DB2CALL	BOLJGQ1	YES
17MAR- 10: 38: 41	DEADLOCK	DB1G	RXDB2	BOLJGQ1	DB2CALL	BOLJGQ1	
17MAR- 10: 37: 41	TIMEOUT	DB1G	RXDB2	BOLJGQ2	DB2CALL	BOLJGQ2	
17MAR- 10: 29: 46	DEADLOCK	DB2G	RXDB2	BOLJGQ2	DB2CALL	BOLJGQ2	
17MAR- 10: 24: 01	TIMEOUT	DB2G	RXDB2	BOLJGQ2	DB2CALL	BOLJGQ2	

Figure 130. LKEVSSI View—Global Lockout Events

The default functions shipped with this view are as follows:

- Sort by
  - Date / Time column
- Hyperlink from
  - Date / Time column to LKEVRES to see the resources involved
  - Victim Plan column to LKWAIT to see other events where this plan was a waiter
  - Global Contention column to LKBWZSSI to see conflicting plans across multiple data sharing DB2 members

## LKEVRES—Lockout Event Resources

The LKEVRES view, shown in [Figure 131](#), lists each resource involved in the selected lockout.

```

>W1 =LKEVENT=LKEVRES=DB2G=====17MAR2001=18:24:40====MVDB2====D====2
Res --Resource Name-- Resource  Resource  Blocker  Waiter  G Blocker  Waiter
Seq Database Object  Number    Type     PlanName PlanName  B Member  Member
  1 DSN8D41A DSN8S41P 000000201 ROW      RXDB2   RXDB2     DB2G     DB2G
  2 DSN8D41A DSN8S41E 0000001200 DATAPAGE RXDB2   RXDB2     DB2G     DB2G
    
```

Figure 131. LKEVRES View—Lockout Event Resources

The default functions shipped with this view are as follows:

- Sort by
  - Res Seq (resource sequence number) column
- Hyperlink from
  - Res Seq column to LKEVD to see full data about the selected resource conflict
  - Resource Name column to LKRESD to see each occurrence by time of any lockout where the selected resource was involved
  - Resource Number column to LKRESD to see each occurrence by time of any lockout where the selected resource was involved

## LKEVD—Lockout Event Resource Detail

The LKEVD view, shown in [Figure 132](#), provides full data about the selected resource conflict.

Figure 132. LKEVD View—Lockout Event Resource Detail

## Resource Conflict Views

The following views display information about resource conflicts.

### LKRESZ—Lockout Resource Summary

The LKRESZ view, shown in [Figure 133](#), lists each resource (database / table space) involved in any conflict.

```

>WI =LKRESZ=====DB2G=====17MAR2001==18: 59: 15====MVB2====D====2
--Resource Name-- Total      % Total      Global
Database Object  Conflicts    0.. 50.. 100  PAGE  ROW  INDEX Conflicts
DSN8D41A DSN8S41E      3  50.0          0     3    0    0         0
DSN8D41A DSN8S41P      3  50.0          0     0    3    0         0
    
```

Figure 133. LKRESZ View—Lockout Resource Summary

You can use this view to see which table spaces cause the most conflicts.

The default functions shipped with this view are as follows:

- Sort by
  - Resource Name column
- Hyperlink from
  - Resource Name column to LKRESNRZ to see each page / row involved in any conflict for the selected resource

## LKRESNRZ—Lockout Resource Number Summary

The LKRESNRZ view, shown in [Figure 134](#), lists each page / row involved in any conflict, usually for a selected resource (database / table space) from LKRESZ.

```
>W1 =LKRESZ===LKRESNRZ(DBGG=====*)=====) 17MAR2001==11:09:06====MVDB2====D====2
```

-- Resource Name--	Resource	Resource	Total	% Total	Global
Database Object	Number	Type	Conflicts	0 . . 50 . . 100	Conflicts
DSN8D41A DSN8S41E	0000001200	DATAPAGE	10	73.9	6
DSN8D41A DSN8S41E	0020000200	DATAPAGE	3	26.1	0

Figure 134. LKRESNRZ View—Lockout Resource Number Summary

You can use this view to see the hot spots in a table by identifying the pages hit.

The default functions shipped with this view are as follows:

- Sort by
  - Resource Name column
  - Resource Number column
- Hyperlink from
  - Resource Name column to LKRESD to see each occurrence by time of the lockouts where the selected resource was involved
  - Resource Number column to LKRESD to see each occurrence by time of the lockouts where the selected resource name/resource number was involved

## LKRESD—Lockout Resource Conflict Detail

The LKRESD view, shown in [Figure 135](#), lists each occurrence by time of any lockout where the selected resource (database / table space or specific page) was involved.

```

>W1 =LKRESD===== (DBGG=====*) 17MAR2001==15: 20: 12====MVDB2=====23
--Resource Name-- Resource  Resource  Time  Lockout  Blocker  Waiter  Gbl
Database Object  Number    Type      -----  Type     PlanName PlanName Con
DSN8D41A DSN8S41E 0000000004 PART-DS 12: 31: 26 TIMEOUT DSNESPRR DSNESPRR
DSN8D41A DSN8S41E 0000000004 PART-DS 12: 27: 35 TIMEOUT DSNESPRR DSNESPRR

DSN8D41A DSN8S41E 0000001200 DATAPAGE 10: 08: 41 DEADLOCK RXDB2    RXDB2    Yes

```

Figure 135. LKRESD View—Lockout Resource Conflict Detail

You can use this view to identify all plans involved in conflicts on this resource and help identify potential application scheduling problems.

The default functions shipped with this view are as follows:

- Sort by
  - Resource Name column
  - Resource Number column
  - Date / Time (hidden) column (descending)

## Involved Thread Views

The following views display information about involved threads.

### LKCONZ—Lockout Connection Summary

The LKCONZ view, shown in [Figure 136](#), lists a summary of lockout victims by connection type.

DB2 Target	Victim ConnType	Victim Connect	Blocker Connect	Timeouts	Deadlocks	% Lockouts
DB1G	CAF	DB2CALL	DB2CALL	1	1	14.3
DB2G	CAF	DB2CALL	DB2CALL	3	7	71.4
DB2G	TSO	TSO	TSO	2	0	14.3

Figure 136. LKCONZ View—Lockout Connection Summary

You can use this view to identify scheduling problems with incompatible workloads (for example, IMS/CICS transactions blocked by batch).

The default functions shipped with this view are as follows:

- Sort by
  - DB2 target
  - Victim ConnType column
  - Victim Connect column
  - Blocker Connect column
- Hyperlink from
  - Victim ConnType column to LKEVSSI to see all lockout events for the selected victim connection type
  - Victim Connect column to LKEVSSI to see all lockout events for the selected victim connection type/connection name
  - Blocker Connect column to LKEVSSI to see all lockout events for the selected blocker connection name

## LKBWZSSI—Lockout Global Blocker/Waiter Summary

The LKBWZSSI view, shown in [Figure 137](#), lists a summary of blocker / waiter plans and systems.

```
>W1 =LKBWZSSI===== (DBGG=====*)=====) 17MAR2001==17: 04: 41====MVDB2====D====5
```

Blocker PlanName	Blocker Member	Waiter PlanName	Waiter Member	Timeout Invol v.	Deadlock Invol v.	% Conflicts	Gbl Con
DSNESP RR	DB2G	DSNESP RR	DB2G	2	0	8.7	0
RXDB2	DB1G	RXDB2	DB1G	2	2	17.4	0
RXDB2	DB1G	RXDB2	DB2G	1	5	26.1	6
RXDB2	DB2G	RXDB2	DB1G	0	5	21.7	5
RXDB2	DB2G	RXDB2	DB2G	2	4	26.1	0

Figure 137. LKBWZSSI View—Lockout Global Blocker/Waiter Summary

You can use this view to identify conflicting plans across multiple data sharing DB2 members.

The default functions shipped with this view are as follows:

- Sort by
  - Blocker PlanName column
  - Blocker Member column
  - Waiter PlanName column
  - Waiter Member column
- Hyperlink from
  - Blocker PlanName column to LKBLOCK to see all conflicts caused by the selected plan
  - Waiter PlanName column to LKWAIT to see all conflicts where the selected plan was a waiter

## LKBWZ—Lockout Blocker/Waiter Summary

The LKBWZ view, shown in [Figure 138](#), lists a summary of blocker / waiter plans.

```
>W1 =LKBWZ=====DB2GXAL==*=====17MAR2001==19: 40: 46====MVDB2====D====1
```

Blocker PlanName	Waiter PlanName	Timeout Invol v.	Deadlock Invol v.	% Conflicts .....	Global 0... 50.. 100	Participant Conf l.	-Only Count
RXDB2	RXDB2	0	10	100.0		0	0

Figure 138. LKBWZ View—Lockout Blocker/Waiter Summary

You can use this view to identify conflicting plans.

The default functions shipped with this view are as follows:

- Sort by
  - Blocker PlanName column
  - Waiter PlanName column
- Hyperlink from
  - Blocker PlanName column to LKBLOCK to see all conflicts caused by the selected plan
  - Waiter PlanName column to LKWAIT to see all conflicts where the selected plan was a waiter

## LKBLOCKZ—Lockout Blocker Plan Summary

The LKBLOCKZ view, shown in [Figure 139](#), summarizes conflicts by blocker IDs.

```
>W1 =LKBLOCKZ=====DB2GXAL=*=====17MAR2001==14: 39: 08====MVDB2====D====2
```

Blocker PlanName	Blocker Connect	Blocker Corr ID	Timeout Invol v.	Deadlock Involv.	% Conflicts .... 0... 50.. 100	Gbl
RXDB2	DB2CALL	BOLJGQ1	1	2	55.6	0
RXDB2	DB2CALL	BOLJGQ2	0	2	44.4	0

Figure 139. LKBLOCKZ View—Lockout Blocker Plan Summary

You can use this view to analyze plans and users causing lockouts.

The default functions shipped with this view are as follows:

- Summarize and sort by:
  - Blocker PlanName column
  - Blocker Connect column
  - Blocker Corr ID column
- Hyperlink from
  - Blocker PlanName column to LKBLOCK to see all conflicts caused by the selected plan

## LKBLOCK—Lockout Blocker Plan Detail

The LKBLOCK view, shown in [Figure 140](#), lists all conflicts by blocker plan and timestamp.

```
>W1 =LKBLOCK=====DB2G=====*=====17MAR2001==11: 18: 27====MVDB2====D====3
```

Blocker PlanName	Blocker Member	Date / Time	Lockout Type	Blocker Connect	Blocker Corr ID	Gbl Con
RXDB2	DB1G	24MAY- 11093599	DEADLOCK	DB2CALL	BOLJGQ2	YES
RXDB2	DB2G	24MAY- 11093599	DEADLOCK	DB2CALL	BOLJGQ1	YES
RXDB2	DB2G	24MAY- 11082634	TIMEOUT	DB2CALL	BOLJGQ1	

Figure 140. LKBLOCK View—Lockout Blocker Plan Detail

You can use this view to identify all specific conflicts caused by a plan over time.

The default functions shipped with this view are as follows:

- Sort by
  - Blocker PlanName column
  - Blocker Member column
  - Date / Time column
- Hyperlink from
  - Date / Time column to LKEVD to see complete details about the selected conflict

## LKWAITZ—Lockout Waiter Plan Summary

The LKWAITZ view, shown in [Figure 141](#), lists conflicts by waiter IDs.

```
>W1 =LKWAITZ=====DB2G=====*=====17MAR2001==19: 55: 47====MVDB2====D====2
```

Waiter PlanName	Waiter Connect	Waiter Corr ID	Timeout Invol v.	Deadlock Invol.	% Conflicts . . . . 0 . . . . 50 . . 100	Gbl
RXDB2	DB2CALL	B0LJGQ2	0	3	50.0	0
RXDB2	DB2CALL	B0LJGQ3	0	3	50.0	0

Figure 141. LKWAITZ View—Lockout Waiter Plan Summary

You can use this view to analyze plans and users suffering most from lockouts.

The default functions shipped with this view are as follows:

- Summarize and sort by:
  - Waiter PlanName column
  - Waiter Connect column
  - Waiter Corr ID column
- Hyperlink from
  - Waiter PlanName column to LKWAIT to see all conflicts where the selected plan was a waiter

## LKWAIT—Lockout Waiter Plan Detail

The LKWAIT view, shown in [Figure 142](#), lists all conflicts by waiter plan and timestamp.

```
>W1 =LKWAIT=====DB2G=====*=====17MAR2001==11: 27: 01====MVDB2====D====3
```

Waiter PlanName	Waiter Member	Date / Time	Lockout Type	Waiter Connect	Waiter Corr ID	Gbl Con
RXDB2	DB1G	24MAY- 11093599	DEADLOCK	DB2CALL	BOLJGQ2	YES
RXDB2	DB2G	24MAY- 11093599	DEADLOCK	DB2CALL	BOLJGQ1	YES
RXDB2	DB2G	24MAY- 11082634	TIMEOUT	DB2CALL	BOLJGQ2	

Figure 142. LKWAIT View—Lockout Waiter Plan Detail

You can use this view to identify all specific conflicts over time where a plan was a waiter.

The default functions shipped with this view are as follows:

- Sort by
  - Waiter PlanName column
  - Waiter Member column
  - Date / Time column
- Hyperlink from
  - Date / Time column to LKEVD to see complete details about the selected conflict

## Chapter 17. ZPARM Installation Parameters

Views for ZPARM installation parameter analysis are organized into seven groups:

- DB2 System
- Locking
- Logging
- Distributed
- Storage and Data Sets
- Authorization
- Application-Related

You can easily access all the views for installation parameter analysis from the DB2 ZPARM Easy Menu (EZDZPARM), as shown in [Figure 143](#).

```

W1 =EZDZPARM=====DB2GMV54=*=====17MAR2001==10: 39: 45====M/DB2====D====1
                                DB2 ZPARM Menu

. Archive Log Allocation > ZPARM Index   . Return. . .

```

Figure 143. EZDZPARM Easy Menu—DB2 Installation Parameters

An index view provides an alphabetic list of all ZPARM names with hyperlinks to the view where they are displayed.

Many of the ZPARM views also provide hyperlinks to related statistics views or tuning wizards to simplify analysis of the effects of various parameters on DB2 performance. You can hyperlink on the following buttons when they are displayed on the right side of a view:

- The WIZARD button to access a DB2 tuning wizard that leads you through all the related information about the selected area of DB2 performance
- The STATS button to see related statistics for each of these time periods:
  - The current recording interval
  - The current session since DB2 was started

## ZPARM Installation Parameters

You can also hyperlink on the NEXT and PREV buttons to easily browse through several or all of the ZPARM views.

Installation parameters highlighted in green (the default color for fields with a defined action) can be modified by overtyping the value, provided you have

- The appropriate authorization
- The BMC Software OPERTUNE for DB2 product installed

When an action is invoked by overtyping a field, the new value is displayed after the successful completion of the OPERTUNE command. The command and the resulting messages are written to the Journal Log. If the command was not successful, ERR appears at the top left of the view and provides a direct hyperlink to display the error messages.

For more information about these commands, see the *OPERTUNE for DB2 Reference Manual*.

Table 9 lists all the views available for installation parameters.

Table 9. Installation Parameter Views

View Name	Group/Type	Description
ZPARCALD	Logging Detail	Archive Log Allocation Definitions (see page 235)  Shows the installation parameter settings for <ul style="list-style-type: none"> <li>Archive Log Allocation Definitions</li> </ul>

  - STATS button to see interval and session counts for DDF definitions or DBAT thread controls
  - NEXT and PREV buttons to see the next or previous ZPARM view

## Storage and Data Set ZPARM Views

The following views display information about storage and data set installation parameters.

### ZPSTGD—Storage-Related Parameters

The ZPSTGD view, shown in [Figure 155](#), shows the installation parameter settings for

- Storage-Related Parameters
- Sort Pool
- RID Pool
- LOB Storage
- Miscellaneous Storage
- Reserved DBMI Storage
- Trace Storage

```

WI =ZPSTGD=====DB2J61E=*=====17MAR2001==18: 59: 57====MVDB2====D====1
. PREV
Storage-Related Parameters..... WI ZARD

## Chapter 18. Dynamic SQL Cache

Views for analysis of the dynamic SQL cache are organized into two groups:

- Dynamic SQL cache statistics views
- Dynamic SQL statement views

You can easily access all the views for dynamic SQL cache analysis from the Dynamic SQL Cache Menu (WZCACHE), as shown in [Figure 165](#).

```

W1 =WZCACHE=====DB2K=====*=====17MAR2001==11: 17: 24====MVDB2===== 1
  Dynamic SQL Cache Menu. . .

  Quick Statistics. . . . . Interval      Sessi on
  Pages Used. . . . .           20
  Inserts. . . . .              0         4.0
  Global Cache Hit ratio. . .  0.0        44.4
  Local Cache Hit ratio. . .  0.0         0.0

. All Statistics. . . . .
. Statement Summary. . . . .

SQL Statement List Views.
. SQL Identifiers. . . . .
. SQL Execution Statistics
. SQL Wait Time Totals. . .
. SQL List (To Customize).

Statement Filters. . . . .
. Set/Clear Filters. . . . .

```

Figure 165. WZCACHE—Dynamic SQL Cache Menu

WZCACHE provides a few key statistics about the dynamic SQL cache usage and performance for each of these time periods:

- The current recording interval
- The current session since DB2 was started

You can hyperlink from this menu to see the complete statistics about the dynamic SQL cache as well as several statement-related views.

The statement-related views will show you whether statistics are being collected at the statement level.

If you want to activate these statistics, issue the following DB2 command:

```
- START TRACE(MON) IFCID(318)
```

Make note of the TNO trace number that is returned in the message from DB2.

Stop the statistics gathering with this DB2 command:

```
- MODIFY TRACE(MON) IFCID(318) TNO(nn)
```

Table 10 lists all the views available for dynamic SQL cache.

Table 10. Dynamic SQL Cache Views

View Name	Group / Type	Description
SCFTOTZ	Statement	Dynamic SQL Cache Filter Results (see page 259)
	Detail Summary	Summarizes the number of statements selected and provides hyperlinks to each of the statement-related tabular views.  It gives you a choice of which tabular view of the selected statements you want to see.
SCLIST	Statement	SQL Cache Statement Elements List (see page 255)
	Tabular	Is provided to make it easy for you to create a customized view of all the elements about the SQL statements in the cache that you want to see in each of the following categories: <ul style="list-style-type: none"> <li>• SQL Identifiers</li> <li>• SQL Execution Statistics</li> <li>• SQL Wait Time Totals</li> </ul>
SCSETF	Statement	SQL Cache Statement Filters (see page 258)
	Detail	Allows you to specify filters to determine which SQL statements are returned. Once set, they remain in effect for your session until cleared.  <b>Note:</b> It is recommended that you specify these filters to select only those statements you want, because the size of the internal buffer may limit the number of statements that can be returned for an unfiltered request.
SCSQL	Statement	SQL Cache Statement List (see page 252)
	Tabular	Lists the SQL statements in the cache with the available identifiers, current usage, and the first part of the SQL text.
SCSQLD	Statement	SQL Cache Statement Detail (see page 256)
	Detail	Provides the complete information available about a selected SQL statement, including identifiers, execution statistics, and wait time totals.
SCSTATS	Statement	SQL Cache Statement Statistics (see page 253)
	Tabular	Is a tabular list of all the statements in the cache showing the collected statistics.
SCSTMTD	Statement	SQL Cache Statement Text (see page 257)
	Tabular	Shows the complete SQL statement text for a selected statement.
SCWAITS	Statement	SQL Cache Statement Waits (see page 254)
	Tabular	Shows the available wait time totals per statement.

Table 10. Dynamic SQL Cache Views (Continued)

View Name	Group / Type	Description
STCACHE	Cache Statistics Tabular	Dynamic SQL Cache Statistics (see page 250)  Provides an overview of the current usage of the cache, whether in the EDM pool or the SQL cache data space. It then provides all the DB2 statistics concerning both global and local cache usage, including hit ratios.
STCACHED	Cache Statistics Detail	Dynamic SQL Cache Statistics Detail (see page 251)  Provides an overview of the current usage of the cache, whether in the EDM pool or the SQL cache data space, for each of these time periods: <ul style="list-style-type: none"> <li>• The current recording interval</li> <li>• The current session since DB2 was started</li> </ul>

## Dynamic SQL Cache Statistics Views

The following views display statistics about the dynamic SQL cache.

### STCACHE—Dynamic SQL Cache Statistics

The STCACHE view, shown in [Figure 166](#), provides an overview of the current usage of the cache, whether in the EDM pool or the SQL cache data space. It then provides all the DB2 statistics concerning both global and local cache usage, including hit ratios.

These statistics are shown for the current recording interval.

+H1 =STCACHE===== (ALL===== *=====) 17MAR2001==16: 55: 05====MVDB2=====9

DB2K	16: 55		10	0. 1	10240	10	10230	0	0

Figure 166. STCACHE View—Dynamic SQL Cache Statistics

The default functions shipped with this view are as follows:

- Hyperlink from
  - DB2 Targ column to STCACHED to see an overview of the current usage of the cache
  - Stmt Discards column to ZPTHDD to see the ZPARAM MAXKEEPD value that controls the size of the local cache

## STCACHED—Dynamic SQL Cache Statistics—Detail

The STCACHED view, shown in [Figure 167](#), provides an overview of the current usage of the cache, whether in the EDM pool or the SQL cache data space.

These statistics are shown for each of these time periods:

- The current recording interval
- The current session since DB2 was started

- Hyperlink from
  - SQL Cache Statement Analysis field to WZCACHE to access the SQL Cache Menu
  - Statement Discarded field to ZPTHDD to see the ZPARM MAXKEEPD value that controls the size of the local cache

## Dynamic SQL Statement Views

The following views display information about dynamic SQL statements. They are based on IFCIDs 316 and 317.

**Note:** It is recommended that you specify filters to select only those statements you want, because the size of the internal buffer may limit the number of statements that can be returned for an unfiltered request. (See “[SCSETF—SQL Cache Statements Filters](#)” on page 258.)

### SCSQL—SQL Cache Statement List

The SCSQL view, shown in [Figure 168](#), lists the SQL statements in the cache with the available identifiers, current usage, and the first part of the SQL text.

```
>W1 =SCSQL=====DB2K=====*=====17MAR2001==11: 23: 04====MVDB2=====5

Figure 170. SCWAITS View—SQL Cache Statement Waits

The default functions shipped with this view are as follows:

- Sort by
  - Execute Count column (ascending)
- Hyperlink from
  - SQL Size column to SCSTMTD to see the complete text of the selected SQL statement

## SCLIST—SQL Cache Statement Elements List

The SCLIST view, shown in [Figure 171](#), is provided to make it easy for you to create a customized view of all the elements about the SQL statements in the cache you want to see in each of the following categories:

- SQL Identifiers
- SQL Execution Statistics
- SQL Wait Time Totals

**Note:** If statistics are not being collected, the values are zero and only the statement identifiers are available.

```

>WI =SCLIST=====DB2K=====*=====17MAR2001==11: 25: 18====MVDB2==== =====5

The default functions shipped with this view are as follows:

- Sort by
  - Line Number column (ascending)

## SCSETF—SQL Cache Statements Filters

The SCSETF view, shown in [Figure 174](#), allows you to specify filters to determine which SQL statements are returned. Once set, they remain in effect for your session until cleared.

**Note:** It is recommended that you specify these filters to select only those statements you want, because the size of the internal buffer may limit the number of statements that can be returned for an unfiltered request.

These filters are those provided by DB2 and can be based only on the statement statistics values.

```

W1 =SCSETF=====DB2K=====17MAR2001==11: 30: 15====MVDB2===== 1

Filter on Statistics (if active).....

Clear Filters(Y,N)..... N

Select Filter Type from List, Overtyp *... *
  E - number of executions.....
  B - number of buffer reads.....
  G - number of getpages.....
  R - number of rows examined.....
  P - number of rows processed.....
  S - number of sorts performed.....
  I - number of index scans.....
  T - number of tablespace scans.....
  L - number of parallel groups.....
  W - number of buffer writes.....
  A - total elapsed time.....
  X - RID list threshold failures.....
  Y - RID list storage failures.....
  C - accumulated CPU time.....
  1 - accumulated wait for synch I/O.....
  2 - accumulated wait for lock/latch....
  3 - accum wait for execution switch....
  4 - accum wait for global locks.....
  5 - accum wait read activity.....
  6 - accum wait write activity.....

Filter Threshold Value..... 1
  Highest records returned if not specified
    
```

Figure 174. SCSETF View—SQL Cache Statement Filters

## SCFTOTZ—Dynamic SQL Cache Filter Results

The SCFTOTZ view, shown in [Figure 175](#), summarizes the number of statements selected and provides hyperlinks to each of the statement-related tabular views.

It gives you a choice of which tabular view of the selected statements you want to see.

W1 =SCFTOTZ=====DB2K=====17MAR2001==11: 30: 51====MVDB2=====1	
Dynamic SQL Cache Filter Results

Figure 175. SCFTOTZ View—Dynamic SQL Cache Filter Results

The default functions shipped with this view are as follows:

- Hyperlink from
  - Statements field to SCSQL to see the identifiers of the selected statements
  - Executions field to SCSTATS to see the execution statistics for the selected statements
  - Sync I/O Wait Time field to SCWAITS to see the available wait time totals for the selected statements
  - Users field to SCLIST to see all the available elements (identifiers, execution statistics, wait time totals) for the selected statements

---

## Chapter 19. Monitors

From the MAINVIEW for DB2 windows environment, you can view the DB2 Workload and Resource Monitor services described in Volume 2 of the *MAINVIEW for DB2 User Guide*. These services are timer-driven monitors that measure DB2 workload and resources over time as requested by a user. A set of monitors is generally activated automatically per DB2 target.

The windows-mode views described in this chapter present the monitor data either for a single DB2 target or for multiple targets in an SSI context. They are organized into three groups:

- Monitor summary views, which show you how many monitors are active and how many have exceeded their warning thresholds:
  - DMON** Summary by target.
  - DMAREAZ** Summary by target and monitor area.
  - DSOVER** Summary by monitor type across multiple targets in an SSI context.
- Monitor detail views, which list individual monitors:
  - DSERV** Lists each active monitor.
  - DMWARN** Lists each active monitor whose threshold has been exceeded.
- Plot views, which show the data collected by a single monitor.

Table 11 lists all the views available for monitors.

Table 11. Monitor Views

View Name	Group / Type	Description
DMAREAZ	Summary	Monitor Summary by Area—Interval (see page 265)
	Summary	Summarizes the monitors by target and monitor area.
DMON	Summary	Monitors by Target—Interval (see page 264)
	Summary	Summarizes the monitors by target for the current interval.
DMONC	Summary	Monitors by Target—Cluster (see page 264)
	Summary	Summarizes the monitors by target for the current interval, for the current realtime period, and for the current session since DB2 was started.
DMONR	Summary	Monitors by Target—Realtime (see page 264)
	Summary	Summarizes the monitors by target for the current realtime period.
DMONS	Summary	Monitors by Target—Session (see page 264)
	Summary	Summarizes the monitors by target for the current session since DB2 was started.
DMWARN	Detail	Monitors in Warning—Realtime (see page 267)
	Tabular	Lists each active monitor whose threshold has been exceeded for the current realtime period.
DSERV	Detail	Monitor Overview—Interval (see page 266)
	Tabular	Lists each active monitor for the current interval.
DSERVC	Detail	Monitor Overview—Cluster (see page 266)
	Tabular	Lists each active monitor for the current interval, for the current realtime period, and for the current session since DB2 was started.
DSERVR	Detail	Monitor Overview—Realtime (see page 266)
	Tabular	Lists each active monitor for the current realtime period.
DSERVS	Detail	Monitor Overview—Session (see page 266)
	Tabular	Lists each active monitor for the current session since DB2 was started.
DSOVER	Summary	Monitors by Type—Interval (see page 265)
	Summary	Summarizes the monitors by type (service and parameter) across multiple targets in an SSI context for the current interval.

Table 11. Monitor Views (Continued)

View Name	Group / Type	Description
DSOVERC	Summary	Monitors by Type—Cluster (see page 265)
	Summary	Summarizes the monitors by type (service and parameter) across multiple targets in an SSI context for the current interval, for the current realtime period, and for the current session since DB2 was started.
DSOVERR	Summary	Monitors by Type—Realtime (see page 265)
	Summary	Summarizes the monitors by type (service and parameter) across multiple targets in an SSI context for the current realtime period.
DSOVERS	Summary	Monitors by Type—Session (see page 265)
	Summary	Summarizes the monitors by type (service and parameter) across multiple targets in an SSI context for the current session since DB2 was started.
Plot Views	Plot	Display the data collected by one monitor.
	Detail	See “Plot Views” on page 268 for a description of each of the plot views.

## Monitor Summary Views

The following views display summary information about how many monitors are active and how many have exceeded their warning thresholds.

### DMON—Target Monitor Summaries

The DMONx views, as shown in [Figure 176](#), summarize the number of monitors started for each target and show how many of those have exceeded their warning thresholds and the average percent of warning. Avg % Warning measures how close the reported data is to the warning threshold set for each monitor.

W1 =DMON=====DB2G=====*=*****17MAR2001==13: 54: 24====MVDB2====D====1						
CMD	Target	Actv	Number in Warn		Avg % Warni ng	Maxi mum
---	-----	Mntrs	0 . . . .	10 . . . . 20	0 . . . . 50 . . . 100 % Warni ng	
	DB2G	83	0		5.4 *	97.1

Figure 176. DMON View—Target Monitor Summaries

There are four similar views that present the data from different time periods:

- DMON—Interval
- DMONR—Realtime
- DMONS—Session
- DMONC—Cluster (all three)

The default functions shipped with these views are as follows:

- Hyperlink from
  - Target column or Actv Mntrs column to see a list of each active monitor for the same time period

## DMAREAZ—Monitor Summary by Area

The DMAREAZ view, shown in [Figure 177](#), summarizes the number of monitors by target and area and shows their status. It summarizes performance by the number of monitors that have exceeded their warning threshold and the average percent of the warning value.

```

W1 =DMAREAZ=====DB2G=====*=====17MAR2001==14: 11: 50====MVDB2====D====9
CMD      Number  Number      Average Maximum Number
--- Target Area   Monitors in Warn 0. . . . . 10 Warning Warning Active
DB2G    WKLD      7      1 *      109.1   763.5   7
DB2G    DMVS      5      0        31.3    93.7    5
DB2G    LOG      8      0        11.2    22.4    8
DB2G    EDM       2      0         4.1     4.1     2
DB2G    USER     22     0         1.4     3.7    22

```

Figure 177. DMAREAZ View—Monitor Summary by Area

The default functions shipped with this view are as follows:

- Hyperlink from
  - Area column or Number Monitors column to DSERV to see a list of active monitors for the selected target and area
  - Number in Warn column to DSERV to see a list of monitors in warning for the selected target and area

## DSOVER—Monitors by Type

The DSOVERx views, as shown in [Figure 178](#), show a performance summary by monitor type (service and parameter) of monitors collecting data from active DB2 targets in the current context. In an SSI context, data from similar monitors across multiple targets are combined and then ranked according to the average percentage of warning threshold. Average percentage of warning measures how close the reported data is to the warning threshold set for the monitor that collects the data.

```

W1 =DSOVER=====DB2G=====*=====17MAR2001==15: 02: 38====MVDB2=====83
CMD Serv  Parm      Avg % Warning Avg      Avg      Area Count
---  ---  ---      0. . . . . 50. . . 100 Value--  Warni ng-  ---  ---
ECSAP      108.6 *****+  76.00   70.00  DMVS    1
CSAP       81.2 *****  65.00   80.00  DMVS    1
LOGUT      22.4 ***      19.00   85.00  LOG     1

CONUT BATCH 3.7 *         3.00   80.00  USER   1
DSUTL      1.2           1.00   85.00  DSYS    1

```

Figure 178. DSOVER View—Monitors by Type

There are four similar views that present the data from different time periods:

- DSOVER—Interval
- DSOVERR—Realtime
- DSOVERS—Session
- DSOVERC—Cluster (all three)

## Monitor Detail Views

The following views display detailed information about each active monitor.

### DSERV—Active Monitors

The DSERVx views, as shown in [Figure 179](#), list the individual monitors by name for each target.

Monitors are ranked according to their average percentage of warning threshold in the time period being reported.

W1 =DSERV=====DB2G=====*=17MAR2001==14: 09: 07====MVDB2=====83							
CMD	Serv	Parm	% Warni ng	Curr	Warn	Area	Target
---	-----	-----	0. . . . 50. . . 100	Val ue---	Val ue---	-----	-----
	ECSAP		97. 4 *****	68. 17	70. 00	DMVS	DB2G
	CSAP		66. 2 *****	53. 00	80. 00	DMVS	DB2G
	LOGUT		22. 4 ***	19. 00	85. 00	LOG	DB2G
	CONUT	TSO	5. 0 *	4. 00	80. 00	USER	DB2G
	EDMUT		4. 7 *	4. 00	85. 00	EDM	DB2G

Figure 179. DSERV View—Active Monitors

There are four similar views that present the data from different time periods:

- DSERV—Interval
- DSERVR—Realtime
- DSERVS—Session
- DSERVCL—Cluster (all three)

The default functions shipped with these views are as follows:

- Hyperlink from
  - Serv column to see a plot of the data collected by the selected monitor

## DMWARN—Monitors in Warning

The DMWARN view, shown in [Figure 180](#), displays only those monitors in a warning condition. It shows how many are in warning and the defined threshold and current measured value for each monitor.

W1 =DMWARN=====DB2G=====*=====17MAR2001==14: 25: 26====MVDB2====D====2									
CMD	Serv	Parm		% Warning		Curr	Warn	Area	Target
-----				0 . . . . 50 . . . 100		Val ue---	Val ue---	-----	
@ELTD	ALLWORK		127.8	*****+		1.28	1.00	WKLD	DB2G
ECSAP			102.1	*****+		71.50	70.00	DMVS	DB2G

Figure 180. DMWARN View—Monitors in Warning

The default functions shipped with this view are as follows:

- Hyperlink from
  - Serv column to see a plot of the data collected by the selected monitor

## Plot Views

When you select a monitor from DSERV or DMWARN, a view showing a plot of the data collected by that monitor is displayed, as shown in [Figure 181](#).

```

Figure 181. Plot View

Each plot provided by a monitor has a hyperlink to a corresponding MVDB2 service that you can use for detail analysis of your target's performance. The hyperlink is indicated by >> in the upper left portion of the view. In the preceding example, it is >>STDB2D. This is a hyperlink to the DB2 Status Detail—Interval view. When you make this hyperlink, you have access to all the related windows mode views provided by MAINVIEW for DB2.

This section lists the monitor plot views for the DB2 workload and resource monitor services described in Volume 2 of the *MAINVIEW for DB2 User Guide*. The descriptions are in tabular form and categorized by DB2 area. Each table shows the plot view and its corresponding monitor and describes the performance data provided.

## DB2 Resource Monitors

This section describes the views and monitors that provide performance plot displays about DB2:

- General DB2 system activity
- User activity
- Lock activity
- EDM pool activity
- Buffer pool activity
- Log activity
- MVS services
- DDF activity

### General DB2 System Monitors (Area = DSYS)

The monitors listed in [Table 12](#) measure general DB2 system activity and status.

Table 12. General DB2 System Monitors

View Name	Monitor	Description
DDSOPN	DSOPN	Reports the number of open DB2 database data sets during the sampling period.
DDSOPR	DSOPR	Reports the number of successful open requests for database data sets by buffer pool during the sampling period. If a large number of databases are specified to automatically open at DB2 startup, a measurement spike occurs at startup.
DDSUTL	DSUTL	Reports the percentage of the maximum number of concurrently accessible DB2 database data sets (DSNZPARM value DSMAX) that are open during the specified time interval.

## User Activity Monitors (Area = USER)

The monitors listed in [Table 13](#) measure user activity.

Table 13. User Activity Monitors

View Name	Monitor	Description						
DBINDF	BINDF	Reports the number of attempted automatic binds that failed during the sampling period.						
DBINDS	BINDS	Reports the number of automatic binds that completed successfully during the sampling period.						
DBNPKF	BNPKF	Reports the number of failed automatic bind requests for packages during the sampling period. The reported value is the difference between the total automatic bind requests for packages minus the successful requests (QTAUTOBA).						
DBNPKS	BNPKS	Reports the number of successful automatic bind requests for packages during the sampling period (QTPKABND).						
DCOMP2	COMP2	Reports the number of successful phase 2 commit requests during the sampling period. A two-phase commit is used by both IMS and CICS transactions.						
DCOMRO	COMRO	Reports the number of read-only commit requests during the sampling period. A read-only commit is a one-phase commit used by IMS and CICS in query-only processing.						
DCOMSY	COMSY	Reports the number of synchronized commit requests during the sampling period. A synchronized commit is used by TSO applications, the Call Attach Facility, and batch applications.						
DCONUT	CONUT	<p>Reports the percentage of active connections of the total allowable during the specified sampling period. The total allowable connections are defined by the following members in the DSNZPARM data set:</p> <table> <tr> <td>IDFORE</td> <td>TSO foreground (QMF or DB2I)</td> </tr> <tr> <td>IDBACK</td> <td>TSO background (batch jobs, CAF, or utilities)</td> </tr> <tr> <td>MAXBAT</td> <td></td> </tr> </table> <p>When CONUT is started without parameters, all active connections are monitored. The percentage is reported as the sum of active connections of the total.</p>	IDFORE	TSO foreground (QMF or DB2I)	IDBACK	TSO background (batch jobs, CAF, or utilities)	MAXBAT	
IDFORE	TSO foreground (QMF or DB2I)							
IDBACK	TSO background (batch jobs, CAF, or utilities)							
MAXBAT								
DDBTQD	DBTQD	Reports the number of times a database access thread was queued because the number of concurrent remote threads was already at a maximum (QDSTQDBT).						

Table 13. User Activity Monitors (Continued)

View Name	Monitor	Description
DDROWA	DROWA	<p>Reports the number of attempts to use Direct Row Access to locate a record during the sampling period (QXROIMAT, QXROIIDX, QXROITS) with one of the following results:</p> <p>USED            DB2 used Direct Row Access to locate a record</p> <p>FAILIX            DB2 attempted to use Direct Row Access but reverted to using an index to locate a record</p> <p>FAILTS            DB2 attempted to use Direct Row Access but reverted to using a table space scan to locate a record</p> <p>FAILURES        Direct Row Access attempts failed</p> <p>If the DROWA monitor is started without parameters (blank), the reported number is the sum of all Direct Row Access attempts during the sampling period.</p> <p>(DB2 Release 6.1 and above)</p>
DEOMFL	EOMFL	Reports the number of end of memory (EOM) failures during the sampling period. The count is incremented when an end of memory request is processed for a DB2-connected address space; for example, at TSO force.
DEOTFL	EOTFL	Reports the number of end of task (EOT) failures during the sampling period. The count is incremented when an end of task request is processed for a DB2-connected address space; for example, an abend of IMS or CICS tasks that have a DB2 thread.
DLOBMX	LOBMX	<p>Reports the maximum storage used for LOB values, in megabytes, during the sampling period (QXSTLOBV).</p> <p>(DB2 Release 6.1 and above)</p>
DNESTM	NESTM	<p>Reports the maximum level of nested SQL cascading due to triggers, user-defined functions, and stored procedures during the sampling period (QXCASCDP).</p> <p>(DB2 Release 6.1 and above)</p>
DPLBND	PLBND	Reports the number of successfully bound plans during the sampling period (QTPLNBD).
DPKBND	PKBND	Reports the number of successfully bound packages during the sampling period (QTPKGBD).
DPRLG	PRLG	Reports the number of parallel groups that executed to the planned parallel degree (QXNORGRP), which executed to a degree less than planned because of a storage shortage or contention on the buffer pool (QXREDGRP), or the total number of parallel groups executed (QXTOTGRP).

## Monitors

Table 13. User Activity Monitors (Continued)

View Name	Monitor	Description
DPRLF	PRLF	<p>Reports the number of planned parallel groups that fallback to sequential execution during the sampling period (QXDEG CUR, QXDEGES A, QXDEGBUF, QXDEGENC) for one of the following reasons:</p> <p>CURSOR      Fallback to sequential because of ambiguous cursor (can be used for update or delete)</p> <p>NOSORT      Fallback to sequential because of lack of ESA Sort support</p> <p>NOBFR      Fallback to sequential because of storage shortage or buffer pool contention</p> <p>NOENCLAV    Fallback to sequential because MVS/ESA enclave services were unavailable (DB2 Release 4.1 and above)</p> <p>If the PRLF monitor is started without parameters (blank), the reported number is the sum of all fallbacks to sequential processing for any reason.</p>
DPRLSF	PRLSF	<p>Reports the number of sysplex query failures during the sampling period (QXCOORNO, QXISORR, QXXCSKIP) for one of the following reasons:</p> <p>COORNO      Failed because coordinator changed to NO</p> <p>ISORR      Failed because of ISOLATION RR/RS</p> <p>CSKIP      Skipped a DB2 because of buffer shortage</p> <p>(DB2 Release 5.1 and above)</p>
DRSQLS	RSQLS	<p>Reports the number of SQL statements sent to a remote site to be executed on behalf of a user at a local site (QLSTSQLS).</p> <p>If the RSQLS monitor is started without parameters (blank), the reported number is the sum of SQL statements sent to all remote sites.</p>
DRSQLR	RSQLR	<p>Reports the number of SQL statements received from a remote site to be executed locally on behalf of a remote user (QLSTSQLR).</p> <p>If the RSQLR monitor is started without parameters (blank), the reported number is the sum of SQL statements received from all remote sites.</p>

Table 13. User Activity Monitors (Continued)

View Name	Monitor	Description										
DSQLAC	SQLAC	<p>Reports the number of SQL statements that executed during the sampling period (QXSETCRL, QXCALL).</p> <p>DSQLAC reports the number of executed statements by the following SQL types:</p> <table> <tr> <td>Data Definition Language</td> <td>Authorization statements</td> </tr> <tr> <td>Lock statements</td> <td>Select/Fetch statements</td> </tr> <tr> <td>Dynamic SQL</td> <td>Update, insert, or delete statements</td> </tr> <tr> <td>Control statements</td> <td>Open statements</td> </tr> <tr> <td>Close statements</td> <td>Stored procedure calls (DB2 Release 4.1 and above)</td> </tr> </table> <p>If the SQLAC monitor is started without parameters (blank), the reported number is the sum of all SQL statement types that executed during the sampling period.</p>	Data Definition Language	Authorization statements	Lock statements	Select/Fetch statements	Dynamic SQL	Update, insert, or delete statements	Control statements	Open statements	Close statements	Stored procedure calls (DB2 Release 4.1 and above)
Data Definition Language	Authorization statements											
Lock statements	Select/Fetch statements											
Dynamic SQL	Update, insert, or delete statements											
Control statements	Open statements											
Close statements	Stored procedure calls (DB2 Release 4.1 and above)											
DSPROC	SPROC	<p>Reports the number of stored procedure calls for all users during the sampling period (QXCALL, QXCALLAB, QXCALLTO, QXCALLRJ). The reported value can be for one of the following types:</p> <table> <tr> <td>CALLS</td> <td>Number of SQL CALL statements that were executed</td> </tr> <tr> <td>ABENDS</td> <td>Number of times a stored procedure terminated abnormally</td> </tr> <tr> <td>TIMEOUTS</td> <td>Number of times an SQL CALL statement timed out while waiting to be scheduled</td> </tr> <tr> <td>REJECTS</td> <td>Number of times an SQL CALL statement was rejected because the procedure was in the 'STOP ACTION(REJECT)' state</td> </tr> </table> <p>If the SPROC monitor is started without parameters (blank), the reported number is the sum of all SQL CALL statements during the sampling period.</p>	CALLS	Number of SQL CALL statements that were executed	ABENDS	Number of times a stored procedure terminated abnormally	TIMEOUTS	Number of times an SQL CALL statement timed out while waiting to be scheduled	REJECTS	Number of times an SQL CALL statement was rejected because the procedure was in the 'STOP ACTION(REJECT)' state		
CALLS	Number of SQL CALL statements that were executed											
ABENDS	Number of times a stored procedure terminated abnormally											
TIMEOUTS	Number of times an SQL CALL statement timed out while waiting to be scheduled											
REJECTS	Number of times an SQL CALL statement was rejected because the procedure was in the 'STOP ACTION(REJECT)' state											
DTHDAB	THDAB	Reports the number of ABORTed threads during the sampling period.										
DTHDAC	THDAC	<p>Reports the number of active threads by one of the following types:</p> <table> <tr> <td>TSO</td> <td>Batch</td> </tr> <tr> <td>Utility</td> <td>Call Attach Facility</td> </tr> <tr> <td>IMS</td> <td>Database Access (DBAT)</td> </tr> <tr> <td>CICS</td> <td>Distributed Allied Agent (DIST)</td> </tr> <tr> <td>Blank</td> <td>Both DBAT and DIST</td> </tr> </table> <p>If the THDAC monitor is started without parameters (blank), the reported number is the sum of active threads of all sampled types.</p>	TSO	Batch	Utility	Call Attach Facility	IMS	Database Access (DBAT)	CICS	Distributed Allied Agent (DIST)	Blank	Both DBAT and DIST
TSO	Batch											
Utility	Call Attach Facility											
IMS	Database Access (DBAT)											
CICS	Distributed Allied Agent (DIST)											
Blank	Both DBAT and DIST											
DTHDCR	THDCR	Reports the number of successful CREATE THREAD requests during the sampling period.										
DTHDID	THDID	Reports the number of in doubt threads during the sampling period. Only IMS or CICS threads can be in doubt.										

## Monitors

Table 13. User Activity Monitors (Continued)

View Name	Monitor	Description										
DTHDQD	THDQD	<p>Reports the number of queued threads by one of the following types:</p> <table border="0"> <tr> <td>TSO</td> <td>Batch</td> </tr> <tr> <td>Utility</td> <td>Call Attach Facility</td> </tr> <tr> <td>IMS</td> <td>CICS</td> </tr> </table> <p>If the THDQD monitor is started without parameters (blank), the reported number is the sum of queued threads of all sampled types.</p>	TSO	Batch	Utility	Call Attach Facility	IMS	CICS				
TSO	Batch											
Utility	Call Attach Facility											
IMS	CICS											
DTHDUT	THDUT	<p>Reports the percentage of active threads from the total allowable during the sampling period. Allowable threads are defined in member CTHREAD of the DSNZPARM data set.</p>										
DTHDWT	THDWT	<p>Reports the number of CREATE THREAD requests that waited for an available thread during the sampling period.</p>										
DTRIGR	TRIGR	<p>Reports the number of triggered actions during the sampling period (QXSTTRG, QXROWTRG, QXTRGERR). The reported value can be for one of the following types:</p> <table border="0"> <tr> <td>STMT</td> <td>Number of times a statement trigger was activated</td> </tr> <tr> <td>ROW</td> <td>Number of times a row trigger was activated</td> </tr> <tr> <td>ERROR</td> <td>Number of times an SQL error occurred during execution of a triggered action</td> </tr> </table> <p>If the TRIGR monitor is started without parameters (blank), the reported number is the sum of all activated triggers during the sampling period.</p> <p>(DB2 Release 6.1 and above)</p>	STMT	Number of times a statement trigger was activated	ROW	Number of times a row trigger was activated	ERROR	Number of times an SQL error occurred during execution of a triggered action				
STMT	Number of times a statement trigger was activated											
ROW	Number of times a row trigger was activated											
ERROR	Number of times an SQL error occurred during execution of a triggered action											
DUDF	UDF	<p>Reports the number of user-defined functions during the sampling period (QXCAUD, QXCAUDAB, QXCAUDTO, QXCAUDRJ). The reported value can be for one of the following types:</p> <table border="0"> <tr> <td>EXECS</td> <td>Number of user-defined functions executed</td> </tr> <tr> <td>ABENDS</td> <td>Number of times a user-defined function terminated abnormally</td> </tr> <tr> <td>TIMEOUTS</td> <td>Number of times a user-defined function timed out while waiting to be scheduled</td> </tr> <tr> <td>REJECTS</td> <td>Number of times a user-defined function was rejected</td> </tr> <tr> <td>FAILURES</td> <td>Number of user-defined functions that failed</td> </tr> </table> <p>If the UDF monitor is started without parameters (blank), the reported number is the sum of all user-defined functions during the sampling period.</p> <p>(DB2 Release 6.1 and above)</p>	EXECS	Number of user-defined functions executed	ABENDS	Number of times a user-defined function terminated abnormally	TIMEOUTS	Number of times a user-defined function timed out while waiting to be scheduled	REJECTS	Number of times a user-defined function was rejected	FAILURES	Number of user-defined functions that failed
EXECS	Number of user-defined functions executed											
ABENDS	Number of times a user-defined function terminated abnormally											
TIMEOUTS	Number of times a user-defined function timed out while waiting to be scheduled											
REJECTS	Number of times a user-defined function was rejected											
FAILURES	Number of user-defined functions that failed											

## Lock Monitors (Area = LOCK)

The monitors listed in [Table 14](#) measure locking activity.

Table 14. Lock Monitors

View Name	Monitor	Description				
DCLM	CLM	Reports the number of claim requests during the sampling period (QTXACLNO).				
DCLMF	CLMF	Reports the number of unsuccessful claim requests during the sampling period (QTXACLUN).				
DDRN	DRN	Reports the number of drain requests during the sampling period (QTXADRNO).				
DDRNF	DRNF	Reports the number of unsuccessful drain requests during the sampling period (QTXADRUN).				
DGNEG	GNEG	Reports the number of times this DB2 was driven to negotiate a p-lock or the number of p-lock change requests (QTGSPPPE, QTGSPGPE, QTGSCHNP, QTGSOTPE).				
DGNOEN	GNOEN	Reports the number of times an engine is not available for a p-lock exit or a notify exit request (QTGSPEQW).				
DGNTFM	GNTFM	Reports the number of notify messages sent or received (QTGSNTFY, QTGSNTFR).				
DGPLK	GPLK	Reports the number of p-lock lock, change, and unlock requests (QTGSLPLK, QTGSCPLK, QTGSUPLK).				
DGSUSP	GSUSP	Reports the number of suspends or global lock or change requests denied (QTGSIGLO, QTGSSGLO, QTGSFLSE, QTGSDRTA).				
DGXES	GXES	Reports the number of both I-lock and p-lock lock, change, and unlock requests propagated to MVS XES synchronously (QTGSLSLM, QTGSCSLM, QTGSUSLM, QTGSKIDS).				
DILREQ	ILREQ	Reports the number of requests to the IMS resource lock manager during the sampling period by one of the following types:  <table style="width: 100%; border: none;"> <tr> <td style="width: 50%;">Query</td> <td style="width: 50%;">Change</td> </tr> <tr> <td>Other</td> <td>All requests to the IRLM address space</td> </tr> </table>	Query	Change	Other	All requests to the IRLM address space
Query	Change					
Other	All requests to the IRLM address space					
DIXLOK	IXLOK	Reports the number of index space locks during the sampling period. An index space lock can be one of the following types:  <table style="width: 100%; border: none;"> <tr> <td style="width: 15%;">Shared</td> <td>Shared index space locks that include SHARE, INTENT SHARE, and SHARE with INTENT EXCLUSIVE</td> </tr> <tr> <td>Exclusive</td> <td>Exclusive index space locks that include UPDATE, INTENT EXCLUSIVE, and EXCLUSIVE</td> </tr> </table> <p>If the IXLOK monitor is started without parameters (blank), the reported number is the sum of all index space locks during the sampling period.</p>	Shared	Shared index space locks that include SHARE, INTENT SHARE, and SHARE with INTENT EXCLUSIVE	Exclusive	Exclusive index space locks that include UPDATE, INTENT EXCLUSIVE, and EXCLUSIVE
Shared	Shared index space locks that include SHARE, INTENT SHARE, and SHARE with INTENT EXCLUSIVE					
Exclusive	Exclusive index space locks that include UPDATE, INTENT EXCLUSIVE, and EXCLUSIVE					

## Monitors

Table 14. Lock Monitors (Continued)

View Name	Monitor	Description
DLDEAD	LDEAD	Reports the number of lock deadlock failures during the sampling period.
DLESCL	LESCL	<p>Reports the number of lock escalations during the sampling period. A lock escalation can be one of the following types:</p> <p>Shared                      Shared lock escalations that include SHARE, INTENT SHARE, and SHARE with INTENT EXCLUSIVE</p> <p>Exclusive                    Exclusive lock escalations that include UPDATE, INTENT EXCLUSIVE, and EXCLUSIVE</p> <p>If the LESCL monitor is started without parameters (blank), the reported number is the sum of all lock escalations during the sampling period.</p>
DLREQ	LREQ	<p>Reports the number of lock or unlock requests during the sampling period.</p> <p>If the LREQ monitor is started without parameters (blank), the reported number is the sum of all lock and unlock requests during the sampling period.</p>
DLSUSP	LSUSP	<p>Reports the number of lock suspensions during the sampling period by one of the following types:</p> <p>Lock suspensions                      Latch suspensions Other suspensions                      All suspensions</p>
DLTIME	LTIME	Reports the number of lock timeout failures during the sampling period.
DMXLOK	MXLOK	Reports the maximum number of locks of any kind (page, row, or table) held by a single user during the sampling period.
DPGLOK	PGLOK	<p>Reports the number of page locks during the sampling period. A page lock can be one of the following types:</p> <p>Shared                      Shared page locks that include SHARE, INTENT SHARE, and SHARE with INTENT EXCLUSIVE</p> <p>Exclusive                    Exclusive page locks that include UPDATE, INTENT EXCLUSIVE, and EXCLUSIVE</p> <p>If the PGLOK monitor is started without parameters (blank), the reported number is the sum of all page locks during the sampling period.</p>

Table 14. Lock Monitors (Continued)

View Name	Monitor	Description
DTSLOK	TSLOK	<p>Reports the number of table space locks during the sampling period. A table space lock can be one of the following types:</p> <p>Shared      Shared table space locks that include SHARE, INTENT SHARE, and SHARE with INTENT EXCLUSIVE</p> <p>Exclusive    Exclusive table space locks that include UPDATE, INTENT EXCLUSIVE, and EXCLUSIVE</p> <p>If the TSLOK monitor is started without parameters (blank), the reported number is the sum of all table space locks during the sampling period.</p>
DUSLOK	USLOK	<p>Reports the number of suspended users because of lock conflicts during the sampling period.</p> <p>Lock conflicts are reported by the following attach types:</p> <ul style="list-style-type: none"> <li>• TSO</li> <li>• Batch</li> <li>• CICS</li> <li>• IMS</li> <li>• Utility</li> <li>• Call Attach Facility</li> <li>• Database Access (DDF servers)</li> <li>• Distributed Allied Agent (DDF requestors)</li> <li>• Both Database Access and Distributed Allied Agent</li> <li>• All (blank parameter)</li> </ul>

## EDM Pool Monitors (Area = EDM)

The monitors listed in [Table 15](#) measure the EDM pool.

Table 15. EDM Pool Monitors

View Name	Monitor	Description
DEDMLD	EDMLD	<p>Reports the average number of EDM page requests per load I/O during the sampling period by one of the following types:</p> <p>Cursor Table (CT) loads                      Package Table (PT) loads            DBD loads    All EDM page requests</p>
DEDMDS	EDMDS	<p>Reports the percentage of Data Space pages used by the EDM pool during the sampling period (QISEDFRE / QISED PGE).</p> <p>(DB2 Release 6.1 and above)</p>
DEDMUT	EDMUT	Reports the percentage of EDM pool pages in use during the sampling period.

## Buffer Pool Monitors (Area = BUFR)

The monitors listed in [Table 16](#) measure the buffer pools.

Table 16. Buffer Pool Monitors

View Name	Monitor	Description
DBPUSE	BPUSE	<p>Reports the percentage of buffer pools specified as in use by a thread. The percentage usage is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DBPUTL	BPUTL	<p>Reports the percentage of buffer pool usage. Unavailable buffer pool pages are assessed whether they are in use or being updated. The percentage usage is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul> <p><b>Note:</b> Unavailable pages are sometimes referred to as nonstealable pages. This includes pages currently in use by a thread and those updated but not yet written to disk.</p>
DDESRD	DESRD	<p>Reports the number of pages for which a destructive read was requested during the sampling period.</p>
DDWTX	DWTX	<p>Reports the number of times that a buffer pool Vertical Deferred Write threshold was exceeded during the sampling period (QBSTDWV). When the number of updated pages for a given data set exceeds the Vertical Deferred Write threshold, deferred writes are initiated for that data set.</p> <p>The count of times that the Vertical Deferred Write threshold was exceeded is reported for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DG2WRF	G2WRF	<p>Reports the number of coupling facility requests to write changed pages to the secondary group buffer pool for duplexing that failed due to a lack of storage in the coupling facility during the sampling period (QBGL2F). The count is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul> <p>(DB2 Release 6.1 and above)</p>
DGCAST	GCAST	<p>Reports the number of times group buffer pool castout was initiated because the class castout threshold was detected or the group buffer pool castout threshold was detected during the sampling period (QBGLCT, QBGLGT).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DGCTPG	GCTPG	<p>Reports the number of pages cast out from the group buffer pool to DASD during the sampling period (QBGLRC).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DGETPG	GETPG	<p>Reports the number of GETPAGE requests during the sampling period. The number of GETPAGE requests is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DGETRI	GETRI	<p>Reports the average number of GETPAGE requests per read I/O during the sampling period. The average number of GETPAGE requests is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>

## Monitors

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DGFAIL	GFAIL	<p>Reports the number of times a castout engine was not available, a coupling facility write engine was not available for coupling facility writes, or coupling facility read or write requests could not complete because of a lack of coupling facility storage resources during the sampling period (QBGLCN, QBGLSU, QBGLRF, QBGLWF).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DGOTHR	GOTHR	<p>Reports the number of other coupling facility requests that are not counted in any of the other QBGL fields during the sampling period (QBGLS).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DGPGWR	GPGWR	<p>Reports the number of changed or clean pages written to the group buffer pool during the sampling period (QBGLSW, QBGLWC, QBGLAW, QBGLAC).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DGRDIN	GRDIN	<p>Reports the number of coupling facility read requests caused by the buffer being marked invalid or the requested page was not found in the buffer pool during the sampling period (QBGLXR, QBGLMR, QBGLAR). Data is not returned from the group buffer pool and a directory entry is created if it does not already exist. This means another DB2 in the group has R/W interest in the page set or partition.</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DGRDNO	GRDNO	<p>Reports the number of coupling facility read requests caused by the buffer being marked invalid or the requested page was not found in the buffer pool during the sampling period (QBGLXN, QBGLMN, QBGLAN). Data is not returned from the group buffer pool and no directory entry is created for this page. This means no other DB2 in the group has R/W interest in the page set or partition.</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DGRDRQ	GRDRQ	<p>Reports the number of coupling facility read requests with data returned during the sampling period (QBGLXD, QBGLMD, QBGLAD).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DHPRDF	HPRDF	<p>Reports the number of read page request failures because the backing expanded store was stolen (castout=yes) or some other error occurred during the sampling period (QBSTHRF + QBSTARF).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DHPVPA	HPVPA	<p>Reports the number of successful asynchronous page moves from the hiperpool to the virtual buffer pool during the sampling interval (QBSTHRA + QBSTARA).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>

## Monitors

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DHPVPS	HPVPS	<p>Reports the number of successful synchronous reads to move a page from a hiperpool to a virtual buffer pool during the sampling period (QBSTHRE).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DHPWRF	HPWRF	<p>Reports the number of write page request failures because the backing expanded store was stolen (castout=yes) or some other error occurred during the sampling period (QBSTHWF + QBSTAWF).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DLSTPF	LSTPF	<p>Reports the number of buffer pool list prefetch requests during the sampling period (QBSTLPF). If the monitor is started without a buffer pool ID, the sum of prefetch requests for all active buffer pools are reported.</p>
DMAXPF	MAXPF	<p>Reports the maximum number of concurrent prefetch I/O streams allocated for parallel processing queries during the sampling interval (QBSTXIS).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DMIAPF	MIAPF	<p>Reports the number of RID list processing failures that occurred during the sampling period. List processing failures are attributed to SQL routines that EXPLAIN indicates will use multi-index access paths, but fail to do so at run-time because storage limits or RID thresholds are exceeded.</p>
DMIGDS	MIGDS	<p>Reports the number of data sets that migrated from a buffer pool during the sampling period.</p> <p>DMIGDS shows the number of migrated data sets for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DPFDIO	PFDIO	<p>Reports the number of asynchronous read I/Os because of a dynamic prefetch during the sampling period (QBSTDIO).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPFDPG	PFDPG	<p>Reports the number of asynchronous page reads because of a dynamic prefetch during the sampling period (QBSTDPP).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPFDRQ	PFDRQ	<p>Reports the number of dynamic prefetch requests during the sampling interval (QBSTDPF).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPFIOF	PFIOF	<p>Reports the number of prefetch I/O stream request failures because of buffer storage shortages during the sampling period (QBSTJIS).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>

## Monitors

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DPFLIO	PFLIO	<p>Reports the number of asynchronous read I/Os caused by list prefetch to a buffer pool during the sampling period (QBSTLIO).</p> <p>The count of asynchronous read I/Os caused by a list prefetch is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPFLPG	PFLPG	<p>Reports the number of asynchronous page reads resulting from a list prefetch during the sampling period (QBSTLPP).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPFLRQ	PFLRQ	<p>Reports the number of list prefetch requests during the sampling period (QBSTLPP). The number of list prefetch requests is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DPFSIO	PFSIO	<p>Reports the number of asynchronous read I/Os caused by sequential prefetch during the sampling period (QBSTPIO).</p> <p>The number of asynchronous read I/Os is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DPFSPG	PFSPPG	<p>Reports the number of asynchronous page reads caused by sequential prefetch during the sampling period (QBSTSPG). This count is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DPFSRQ	PFSRQ	<p>Reports the number of sequential prefetch requests for a buffer pool during the sampling period (QBSTSEQ).</p> <p>The number of sequential prefetch requests is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DPFTIO	PFTIO	<p>Reports the number of asynchronous read I/Os caused by prefetch during the sampling period. The count is calculated as the sum (QBSTPIO + QBSTLIO + QBSTDIO).</p> <p>The count of asynchronous read I/Os caused by prefetch is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPFTPG	PFTPG	<p>Reports the number of total asynchronous page reads caused by prefetch during the sampling period. The count is calculated as the sum (QBSTSP + QBSTLPP + QBSTDPP).</p> <p>The count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPFTRQ	PFTRQ	<p>Reports the number of total prefetch requests from an active buffer pool during the sampling period. The count is calculated as the sum (QBSTSEQ + QBSLTLPP + QBSTDPF).</p> <p>The count of total prefetch requests is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>

## Monitors

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DPPIO	PIO	<p>Reports the number of prefetch read I/Os that occurred during the sampling period. The number of prefetch read I/Os are shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DPRL12	PRL12	<p>Reports the number of times that a prefetch quantity is reduced from normal to one-half during the sampling period (QBSTPL1).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPRL14	PRL14	<p>Reports the number of times that a prefetch quantity is reduced from one-half of normal to one-quarter during the sampling period (QBSTPL2).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPRLGF	PRLGF	<p>Reports the number of times that a conditional GETPAGE request cannot be satisfied from a buffer pool during the sampling period (QBSTNGT).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPRLQ	PRLQ	<p>Reports the number of parallel processing requests in the buffer pool during the sampling period (QBSTPQO).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DPRLQF	PRLQF	<p>Reports the number of times that DB2 cannot allocate the requested number of buffer pages to allow a parallel group to run to the planned degree during the sampling period (QBSTPQF).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DPWS	PWS	<p>Reports the number of database system pages that were written during the sampling period. The number of written database system pages is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DPWSWI	PWSWI	<p>Reports the average number of system pages written per write I/O during the sampling period. The average number of written system pages for each write I/O is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DRIDUT	RIDUT	<p>Reports the percentage of RID control blocks in use during the sampling period. The percentage is calculated as the number of used RID blocks divided by the total number of available RID blocks.</p>
DRIO	RIO	<p>Reports the number of media manager read I/O requests during the sampling period. The counts are either a GETPAGE request or a multiple page request for a prefetch function. The number of media manager read I/O requests is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>

Table 16. Buffer Pool Monitors (Continued)

<b>View Name</b>	<b>Monitor</b>	<b>Description</b>
DRTO	RTO	Shows the number of HSM recall timeouts that occurred during the sampling period. The number of HSM recall timeouts are shown for one of the following buffer pools: <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DRWP	RWP	Reports the number of reads with paging during the sampling period. The reported value is the number of times a buffer did not have real storage frame backing when being PAGEFIXed to perform a read I/O. The count is shown for one of the following buffer pools: <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DSEQIO	SEQIO	Reports the number of synchronous read I/Os issued by sequential access requesters in the sampling period (QBSTSIO). A synchronous read I/O occurs as a result of a disabled prefetch or when the requested pages are not consecutive. <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DSEQPG	SEQPG	Reports the number of GETPAGE requests issued by sequential access requesters during the sampling period (QBSTSGT). <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DSWS	SWS	Reports the number of system updates (SWS) during the sampling period. The count increments by one each time a row in a database system page is updated. The number of system updates is shown for one of the following buffer pools: <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>

Table 16. Buffer Pool Monitors (Continued)

View Name	Monitor	Description
DSWSPW	SWSPW	<p>Reports the average number of updates for each system page written during the sampling period. The average number of updates for each system page is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DWIO	WIO	<p>Reports the number of media manager write I/O requests during the sampling period. Requests can batch-write I/O to allow multiple pages to be written per a single call to the media manager. The number of media manager write I/O requests is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0-BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K-BP32K9</li> <li>• All active pools</li> </ul>
DWKMAX	WKMAX	<p>Reports the maximum number of work files in use during merge processing in the sampling period (QBSTWFM).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>
DWKNBF	WKNBF	<p>Reports the number of work files that cannot be created because of insufficient buffer resources during the sampling period (QBSTMAX).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"> <li>• BP0 through BP49</li> <li>• BP8K-BP8K9</li> <li>• BP16K-BP16K9</li> <li>• BP32K through BP32K9</li> <li>• All active buffer pools</li> </ul>

## Monitors

Table 16. Buffer Pool Monitors (Continued)

<b>View Name</b>	<b>Monitor</b>	<b>Description</b>
DWKPFZ	WKPFZ	<p>Reports the number of work file sequential prefetches that did not occur because the dynamic prefetch quantity is zero during the sampling period (QBSTWKPD).</p> <p>This count is shown for the following buffer pools:</p> <ul style="list-style-type: none"><li>• BP0 through BP49</li><li>• BP8K-BP8K9</li><li>• BP16K-BP16K9</li><li>• BP32K through BP32K9</li><li>• All active buffer pools</li></ul>
DWWP	WWP	<p>Reports the number of writes with paging during the sampling period. The reported value is the number of times a buffer did not have real storage frame backing when being PAGEFIXed to perform a write I/O. The count is shown for one of the following buffer pools:</p> <ul style="list-style-type: none"><li>• BP0-BP49</li><li>• BP8K-BP8K9</li><li>• BP16K-BP16K9</li><li>• BP32K-BP32K9</li><li>• All active pools</li></ul>

## Log Monitors (Area = LOG)

The monitors listed in [Table 17](#) measure logging activity.

Table 17. Log Monitors

View Name	Monitor	Description
DARCDL	ARCDL	Reports the number of read accesses delayed because of unavailable resources during the sampling period.
DARCRA	ARCRA	Reports the number of read archive logs allocated during a sampling interval. Read archive logs are allocated when backout or recovery data requests cannot be satisfied from the log buffers or from the active log.
DARCTC	ARCTC	Reports the number of read accesses delayed because of tape mount contention during the sampling period.
DARCTM	ARCTM	Reports the number of look-ahead tape mount requests that occurred during the sampling period.
DARCWA	ARCWA	Reports the number of archive logs allocated as a result of an active log data set being archived during the sampling period.
DARCWR	ARCWR	Reports the number of control intervals (CIs) that are archived during the sampling period.
DBSDSA	BSDSA	Reports the number of accesses to the Bootstrap Data Set (BSDS) during the sampling period.
DCHKPT	CHKPT	Reports the number of DB2 checkpoints taken during the sampling interval.
DCKPFR	CHKPT	<p>Reports the number of DB2 checkpoints taken during the sampling interval. The purpose of this monitor is to report that fewer than the specified number of checkpoints have occurred in the specified time interval.</p> <p>Suggested values to start this monitor are:</p> <ul style="list-style-type: none"> <li>• An interval of 20 minutes</li> <li>• A value of less than 1</li> </ul> <p>For example: INTERVAL=20:00 WWAL=&lt;1</p> <p>In this example, the message will be issued if no checkpoints occur in a twenty minute interval.</p>
DLOGRD	LOGRD	Reports the number of log reads for backout or recovery during the sampling period. The number is the sum of log reads satisfied from active log buffers, log data sets, archive logs, or from other sources.
DLOGUT	LOGUT	Reports the percentage of log CIs in use during the sampling interval.
DLOGWR	LOGWR	Reports the number of log write requests during the sampling interval. The reported number of log write requests can be selected as either FORCE, NOWAIT, or the total of all requests.
DLOGWT	LOGWT	Reports the number of log request waits because log buffers were unavailable during the sampling period.

## MVS Services (Area = DMVS)

The monitors listed in [Table 18](#) measure MVS activities that may affect DB2 performance.

Table 18. MVS Services

View Name	Monitor	Description
DCSAPG	CSAPG	Reports the total number of page requests to the common storage area (CSA) during the sampling period.
DCSAP	CSAP	Reports the percent usage of CSA during the sampling period. CSA percent usage is calculated with the following formula:  $100 * \frac{((\text{Total CSA}) - (\text{Space described by FBQEs in CSA}))}{(\text{Total CSA})}$
DDB2DP	DB2DP	Reports the number of page-in requests for the MVS image or by the specified address spaces listed below: <ul style="list-style-type: none"> <li>• IMS Resource Lock Manager address space</li> <li>• DB2 System Service address space</li> <li>• DB2 Database Service address space</li> <li>• DDF address space plus the three address spaces listed above</li> <li>• DDF address space only</li> <li>• Total page-in requests for the MVS image</li> </ul>
DECSAP	ECSAP	Reports the extended CSA percent usage during the sampling interval. Extended CSA percent usage is calculated with the following formula:  $100 * \frac{((\text{Total ECSA}) - (\text{Space described by FBQEs in ECSA}))}{(\text{Total ECSA})}$

## DDF Monitors (Area = DDF)

The monitors listed in [Table 19](#) measure activity in the DB2 Distributed Data Facility address space.

Table 19. DDF Monitors

View Name	Monitor	Description
DCNVLM	CNVLM	Reports the number of conversations that are deallocated because the ZPARM limit was reached for maximum concurrent threads during a sampling interval (QDSTQCRT).
DDBATQ	DBATQ	<p>Reports the number of DBATs queued because the MAXDBAT limit was reached during the sampling period (QDSTQDBT, QDSTQIN2). The reported value can be for the following type:</p> <p><b>NEW</b>                      Number of times that a new Database Access Thread (DBAT) was queued because it reached the ZPARM maximum for active remote threads (QDSTQDBT)</p> <p>If the DBATQ monitor is started without parameters (blank), the reported value is the number of times that a new or reactivated type 2 DBAT was queued because it reached the ZPARM maximum for active remote threads during the sampling period.</p> <p>For DB2 Release 5.1, this value is the same as for the NEW parameter (QDSTQDBT).</p> <p>For DB2 Release 6.1 and above, this value indicates the number of queued receive requests for a type 2 inactive thread, plus the number of queued requests for new connections. These requests were received after the maximum number of remote active threads was reached (ZPARM MAXDBAT) (QDSTQIN2).</p> <p>(DB2 Release 5.1 and above)</p>
DDDFBS	DDFBS	Reports the total bytes sent from the monitor target to all remote locations or to specified locations during the sampling period.
DDDFBR	DDFBR	Reports the total bytes received at the monitor target location from all remote locations or from specified locations during the sampling period.
DDDFCQ	DDFCQ	Reports the number of queued conversations because the session limit has been reached for all LUs or for specified LUs during a sampling interval.
DDDF1	DDFT1	<p>Reports the number of connections that were terminated instead of made type 1 inactive because the maximum number of type 1 inactive threads was reached during the sampling period (QDSTNITC).</p> <p>(DB2 Release 6.1 and above)</p>
DNACTC	NACTC	Reports the number of inactive database access threads during a sampling period (QDSTQCIT).

## Monitors

Table 19. DDF Monitors (Continued)

<b>View Name</b>	<b>Monitor</b>	<b>Description</b>
DP2CON	P2CON	Reports the number of connections with two-phase commit operations (QDSTQCIT + QDSTWSTR), cold started connections (QDSTCSTR), and warm started connections (QDSTWSTR) during a sampling interval.
DP2RSY	P2RSY	Reports the number of resynchronization connections attempted with all remote locations for two-phase commit operations (QDSTRSAT), successful attempts (QDSTRSSU), and unsuccessful attempts (QDSTRSAT - QDSTRSSU) during a sampling period.
DP2RMT	P2RMT	Reports the number of operations that have the remote location as the coordinator or for all remote locations during the specified time interval (QLSTINDT + QLSTCPTR + QLSTRBTR).
DP2RMI	P2RMI	Reports the number of threads that became INDOUBT that have the remote location as the coordinator or for all remote locations during the specified time interval (QLSTINDT).
DP2RMC	P2RMC	Reports the number of COMMIT operations that have the specified location as the coordinator or for all remote locations during the specified time interval (QLSTCPTR).
DP2RMR	P2RMR	Reports the number of ROLLBACK operations that have the specified locations as the coordinator or for all remote locations during the specified time interval (QLSTRBTR).

## DB2 Workload Monitors

This section describes the views and monitors that provide performance plot displays about DB2 workloads.

### SQL Monitors (Area = WKLD)

The monitors listed in [Table 20](#) measure the number and type of SQL calls made.

Table 20. SQL Monitors

View Name	Monitor	Description
D#SQLD	#SQLD	Reports the number of Data Definition Language statements (CREATE, ALTER, DROP) during the sampling period (QXCRTAB + QXCRINX + QXCTABS + QXCRSYN + QXCRDAB + QXCRSTG + QXDEFVU + QXDRPIX + QXDRPTA + QXDRPTS + QXDRPDB + QXDRPSY + QXDRPST + QXDRPVU + QXALTST + QXFETCH + QXALTTS + QXALTTA + QXALTIX + QXDRPAL + QXCRALS + QXALDAB + QXDRPPKG).
D#SQLM	#SQLM	Reports the number of data manipulative SQL statements issued by a transaction (SELECT, INSERT, UPDATE, DELETE, PREPARE, OPEN, CLOSE, FETCH) during the sampling period (QXSELECT + QXFETCH + QXINSRT + QXDELET + QXUPDTE + QXOPEN + QXCLOSE + QXPREP).
D#SQLA	#SQLA	Reports the number of SQL administrative statements issued by a transaction during the sampling period. This includes <ul style="list-style-type: none"> <li>• LOCK TABLE</li> <li>• COMMENT</li> <li>• LABEL</li> <li>• GRANT</li> <li>• REVOKE</li> <li>• SET CURRENT SQL ID</li> <li>• SET CONNECTION</li> <li>• SET CURRENT DEGREE</li> <li>• CONNECT</li> <li>• RELEASE</li> <li>• SET CURRENT RULES (DB2 Release 4.1 and above)</li> </ul> (QXCMTON + QXLOCK + QXGRANT + QXREVOK + QXLABON + QXSETSQL + QXCON1 + QXCON2 + QXREL + QXSETCON + QXSETCDG + QXSETCRL).
D#SQLC	#SQLC	Reports the number of SQL statements per commit point (SELECT, FETCH, INSERT, DELETE, UPDATE) during the sampling period (QXSELECT + QXFETCH + QXINSRT + QXDELET + QXUPDTE).
D#DYN	#DYN	Reports the number of dynamic SQL statements (PREPARE) during the sampling period (QXPREP).
D#CALL	#CALL	Reports the number of stored procedure calls during the sampling period (QXCALL).

## Monitors

Table 20. SQL Monitors (Continued)

View Name	Monitor	Description
D#SPRC	#SPRC	Reports the number of stored procedures executed during the sampling period (QXCALL, QXCALLAB, QXCALLTO, QXCALLRJ).
D#REOP	#REOP	Reports the number of times that reoptimization for host variables occurred during the sampling period (QXSTREOP). (DB2 Release 5.1 and above)

## CPU Usage Monitors (Area = WKLD)

The monitors listed in [Table 21](#) measure the use of CPU time by a transaction.

Table 21. CPU Usage Monitors

View Name	Monitor	Description
D@CPU	@CPU	Reports the average CPU time used by a transaction during the sampling period (QWACSPCP + QWACEJST - QWACBJST).
D@CPUD	@CPUD	Reports the average CPU time in DB2 used by a transaction during the sampling period (QWACAJST + QWACSPPT).

## Transaction Usage Monitor (Area = WKLD)

The monitor listed in [Table 22](#) measures the amount of DB2 transactions processed.

Table 22. Transaction Workload Monitor

View Name	Monitor	Description
D#PROC	#PROC	Reports the number of processed DB2 transactions during the sampling period. A transaction is equivalent to a DB2 accounting record.

## Buffer Usage Monitors (Area = WKLD)

The monitors listed in [Table 23](#) measure the amount of buffer usage activity.

Table 23. Buffer Usage Monitors

View Name	Monitor	Description
D#GETP	#GETP	Reports the number of GETPAGE requests in the buffer pools during the sampling period (QBACGET).
D#UPDP	#UPDP	Reports the number of update page requests in the buffer pool during the sampling period (QBACSWU + QBACSWU).
D#RDIO	#RDIO	Reports the number of synchronous read I/O requests processed during the sampling period (QBACRIO).
D#PFRD	#PFRD	Reports the number of prefetch read requests processed during the sampling period.
D#WRIT	#WRIT	Reports the number of Write Immediate I/O requests processed during the sampling period (QBACIMW).
D#PFRQ	#PFRQ	Reports the number of prefetch requests processed (sequential, list, dynamic) during the sampling period (QBACSEQ + QBACLPF + QBACDPF).
D#PFIO	#PFIO	Reports the number of prefetch I/O requests processed during the sampling period (QBACRIO).
D#PFPG	#PFPG	Reports the number of prefetch I/O pages read during the sampling period (QBACSIO).
D#GETF	#GETF	Reports the number of conditional GETPAGE failures in the buffer pools during the sampling period (QBACNGT).
D#HPVS	#HPVS	Reports the number of successful synchronous reads to move a page from a hiperpool to a virtual buffer pool during the sampling period (QBACHRE).
D#HPPG	#HPPG	Reports the number of pages found in a hiperpool and moved to a virtual buffer pool because of a prefetch under control of the agent during the sampling period (QBACHPG).
D#GSRD	#GSRD	Reports the number of coupling facility read requests because of the buffer being marked invalid or the requested page not found in the buffer pool during the sampling period (QBGAXD, QBGAXR, QBGAXN, QBGAMD, QBGAMR, QBGAMN).
D#GSWR	#GSWR	Reports the number of changed pages written to the group buffer pool during the sampling period (QBGASW).
D#GSWC	#GSWC	Reports the number of clean pages written to the group buffer pool during the sampling period (QBGAWC).

## Lock Usage Monitors (Area = WKLD)

The monitors listed in [Table 24](#) measure lock activity and contention.

Table 24. Lock Usage Monitors

View Name	Monitor	Description
D#DDLK	#DDLK	Reports the number of deadlock conditions detected during the sampling period (QTXADEA).
D#TMO	#TMO	Reports the number of times the transaction timed out waiting for a lock or latch during the sampling period (QTXATIM).
D#SUSP	#SUSP	Reports the number of times the transaction was suspended for a lock or latch during the sampling period (QTXASLOC).
D#ESCL	#ESCL	Reports the number of lock escalations that occurred during the sampling period (QTXALES + QTXALEX).
D#MAXL	#MAXL	Reports the maximum number of locks held by a transaction during the sampling period (QTXANPL).
D#CLMF	#CLMF	Reports the number of claim request failures detected during the sampling period (QTXACLUN).
D#DRNF	#DRNF	Reports the number of drain request failures detected during the sampling period (QTXADRUN).
D#GSUS	#GSUS	Reports the number of suspensions because of global resource contention during the sampling period (QTGAIGLO, QTGASGLO, QTGAFLSE).
D#GFAL	#GFAL	Reports the number of suspensions caused by false contentions during the sampling period (QTGAFLSE).
D#GRTA	#GRTA	Reports the number of global lock or change requests denied because of an incompatible retained lock during the sampling period (QTGADRTA).
D#GLRQ	#GLRQ	Reports the number of lock requests for p-locks during the sampling period (QTGALPLK).
D#GLKX	#GLKX	Reports the number of both l-lock and p-lock requests propagated to MVS XES synchronously during the sampling period (QTGALSLM).
D#GNTS	#GNTS	Reports the number of notify messages sent during the sampling period (QTGANTFY).

## Elapsed Time Monitors (Area = WKLD)

The monitors listed in [Table 25](#) measure elapsed time for a transaction, DB2 processing, I/O operations, or lock or latch waits.

Table 25. Elapsed Time Monitors

View Name	Monitor	Description
D@ELAP	@ELAP	Reports the average elapsed time for a transaction during the sampling period (QWACESC - QWACBSC).
D@ELTM	@ELTM	Reports the elapsed time for transactions that occur within DB2 targets defined as part of a MAINVIEW for DB2 workload during the sampling period.  <b>Note:</b> This monitor is automatically invoked when a DB2 workload is started.
D@ELPD	@ELPD	Reports the average elapsed time in DB2 processing during the sampling period (QWACASC).
D@ELTD	@ELTD	Reports the elapsed time for DB2 transactions that occur within targets defined as part of a MAINVIEW for DB2 workload during the sampling period.  <b>Note:</b> This monitor is automatically invoked when a DB2 workload is started.
D@ELP3	@ELP3	Reports the average elapsed time spent waiting for all accounting class 3 reasons during the sampling period (QWACCAST, QWACAWTG, QWACAWTJ, QWACAWTI, QWACAWTL, QWACAWDR, QWACAWCL, QWACAWTP) (QWACAWTR).
D@ELIO	@ELIO	Reports the average elapsed time doing I/O operations during the sampling period (QWACAWTI).
D@ELLK	@ELLK	Reports the average elapsed time the transaction spent waiting for locks or latches in DB2 during the sampling period (QWACAWTL + QWACAWDR + QWACAWCL + QWACAWTP).
D@ELPR	@ELPR	Reports the average elapsed time spent processing prefetch reads during the sampling period (QWACAWTR).
D@ELDR	@ELDR	Reports the average elapsed time the transaction spent waiting for drain during the sampling period (QWACAWDR).
D@ELCL	@ELCL	Reports the average elapsed time the transaction spent waiting for claim during the sampling period (QWACAWCL).
D@ELPL	@ELPL	Reports the average elapsed time the transaction spent waiting for page latch during the sampling period (QWACAWTP).
D@ELSP	@ELSP	Reports the average elapsed time spent waiting for an available TCB before the stored procedure could be scheduled during the sampling period (QWACCAST).

## Monitors

Table 25. Elapsed Time Monitors (Continued)

View Name	Monitor	Description
D@ELGM	@ELGM	Reports the average elapsed wait time caused by suspension for sending messages to other members in the data sharing group during the sampling period (QWACAWTG).
D@ELGL	@ELGL	Reports the average elapsed wait time caused by suspension of an IRLM lock request due to global lock contention that requires inter-system communication to resolve during the sampling period (QWACAWTJ).

## I/O Parallelism Monitors (Area = WKLD)

The monitors listed in [Table 26](#) measure the amount of parallel I/O for a transaction.

Table 26. I/O Parallelism Monitors

View Name	Monitor	Description
D#PRLG	#PRLG	Reports the total number of parallel groups executed during the sampling period (QXTOTGRP).
D#PRLR	#PRLR	Reports the number of parallel groups executed to a degree less than planned due to storage shortage or buffer pool contention during the sampling period (QXREDGRP).
D#PRLF	#PRLF	Reports the number of parallel groups that fell back to sequential operation during the sampling period due to <ul style="list-style-type: none"> <li>• Ambiguous cursor</li> <li>• Lack of ESA SORT support</li> <li>• Storage shortage or buffer pool contention</li> <li>• Unavailable MVS/ESA enclave services (DB2 Release 4.1 and above)</li> <li>• Query Parallelism disabled by the RLF (DB2 Release 4.1 and above)</li> </ul> (QXDEGCUR + QXDEGESA + QXDEGBUF + QXDEGENC + QXRLFDPA).
D#PRLS	#PRLS	Reports the number of sysplex query failures during the sampling period (QXCOORNO + QXISORR + QXCSKIP). (DB2 Release 5.1 and above)

---

## Part 5. Appendixes/Glossary

This part gives information about data found in views.

<b>Appendix A. Lock Type Table</b> .....	303
<b>Appendix B. View Conventions</b> .....	307
Numeric Values .....	307
Graph Values .....	307
<b>Glossary</b> .....	309

## Appendix A. Lock Type Table

Table 27 defines the possible lock types and resources for the lock-related detail trace events:

- Detail logical lock - IFCID 21
- Lock Suspension - IFCID 44/45
- Deadlock - IFCID 172
- Timeout - IFCID 196
- Detail physical locks (P-Locks) - IFCIDs 251, 259

Table 27. Lock Types

Lock Type (short)	Lock Type (long)	Resource Name	Resource Number (hex)
ALTER BP	ALTER BUFFERPOOL	BP = bpid	
BINDLOCK	AUTOBIND/REMOTE BIND	BINDLOCK	
CATM CAT	CATMAINT CONVERT CATALOG	DB = database OB = pageset	
CATM DIR	CATMAINT CONVERT DIRECTORY	DB = database OB = pageset	
CATM MIG	CATMAINT MIGRATION	DB = database OB = pageset	
CDB PLOK	CDB P-LOCK (DDF)	DB = database	
COLLECTN	COLLECTION	Collection ID	
CS-DRAIN	CURSOR STABILITY DRAIN	DB = database OB = pageset	Part# / 0
DATABASE	DATABASE	DB = database	
DATAPAGE	DATA PAGE	DB = database OB = pageset	Page#
DBALLOC	DBALLOC - START/STOP	DB = database OB = pageset	Part# / 0
DBCMDSER	DB CMD SERIAL	DB = database	
DBD PLOK	DBD P-LOCK	DB = database	
GBP CAST	GROUP BP CASTOUT P-LOCK	BP = bpid	
GP EX UP	GROUP DB EXCEPTION UPDATE	DX = GDBET	
GROUP BP	GROUP BP START/STOP	BP = bpid	
HASH-ANC	HASH ANCHOR	DB = database OB = pageset	Page# Anchor

Table 27. Lock Types (Continued)

Lock Type (short)	Lock Type (long)	Resource Name	Resource Number (hex)
INDEXPAG	INDEX PAGE (# = x'000002FF', index root page)	DB = database OB = pageset	Page# Subpage#
IX EOF	INDEX END-OF-FILE	DB = database OB = pageset	Part# / 0
IXTREEPL	INDEX MANAGER TREE P-LOCK	BP = bpid DB = database OB = pageset	
LPL/GREC	LPL/GRECP DB EXCEPTION	DB = database OB = pageset	Part# / 0
MASSDEL	MASS DELETE	DB = database OB = pageset	
OPEN	OPEN PAGESET / DATASET	DB = database OB = pageset	
PAGE PLK	PAGE P-LOCK	BP = bpid DB = database OB = pageset	Part# / 0 Page#
PAGESET	PAGE SET	DB = database OB = pageset	
PART-DS	PARTITIONED DATASET	DB = database OB = pageset	Part#
PARTLOCK	PARTITION LOCKING	DB = database OB = pageset	Part#
P/P CAST	PAGESET/PARTITION CASTOUT PLOCK	BP = bpid DB = database OB = pageset	Part# / 0
P/P PLOCK	PAGESET/PARTITION P-LOCK	BP = bpid DB = database OB = pageset	Part# / 0
REPR DBD	REPAIR DBD TEST/DIAGNOSE	DB = database OB = pageset	
RLF PLOCK	RLF P-LOCK	DB = database OB = pageset	
ROW	ROW	DB = database OB = pageset	Page# RID
RR-DRAIN	REPEATABLE READ DRAIN	DB = database OB = pageset	Part# / 0
SCA ACC	SCA ACCESS - RESTART/REDO	SC = BMC-RSTP	
SERVICE	SERVICEABILITY	(not identified)	

Table 27. Lock Types (Continued)

<b>Lock Type (short)</b>	<b>Lock Type (long)</b>	<b>Resource Name</b>	<b>Resource Number (hex)</b>
SKCT	SKELETON CURSOR TABLE	PL = planname	
SKPT	SKELETON PACKAGE TABLE	PK = Collection, package, token	
SYSLGRNG	SYSLGRNG RECORDING	DB = database OB = pageset	
TABLE	TABLE	DB = database OB = pageset	
UTIL EXC	UTILITY EXCLUSIVE EXECUTION	UTEXEC	
UTILSER	UTILITY SERIALIZATION	UTSERIAL	
UTILUID	UTILITY UID	UI = utility ID	
WR-DRAIN	WRITE DRAIN	DB = database OB = pageset	Part# / 0

- Page# is 0 for unlocks.
- P-Locks do not cause timeouts or deadlocks, so do not appear for these events.

---

# Glossary

This glossary defines BMC Software terminology. Other dictionaries and glossaries may be used in conjunction with this glossary.

Since this glossary pertains to BMC Software-related products, some of the terms defined may not appear in this book.

To help you find the information you need, this glossary uses the following cross-references:

<b>Contrast with</b>	Indicates a term that has a contrary or contradictory meaning.
<b>See</b>	Indicates an entry that is a synonym or contains expanded information.
<b>See also</b>	Indicates an entry that contains related information.

---

## A

**action.** Defined operation, such as modifying a MAINVIEW window, that is performed in response to a command. *See* object.

**active window.** Any MAINVIEW window in which data can be refreshed. *See* alternate window, current window, window.

**administrative view.** Display from which a product's management tasks are performed, such as the DSLIST view for managing historical data sets. *See* view.

**ALT WIN field.** Input field that allows you to specify the window identifier for an alternate window where the results of a hyperlink are displayed. *See* alternate window.

**Alternate Access.** *See* MAINVIEW Alternate Access.

**alternate form.** View requested through the FORM command that changes the format of a previously displayed view to show related information. *See also* form, query.

**alternate window.** (1) Window that is specifically selected to display the results of a hyperlink. (2) Window whose identifier is defined to the ALT WIN field. *Contrast with* current window. *See* active window, window, ALT WIN field.

**analyzer.** (1) Online display that presents a snapshot of status and activity data and indicates problem areas. (2) Component of CMF MONITOR. *See* CMF MONITOR Analyzer.

**application.** (1) Program that performs a specific set of tasks within a MAINVIEW product. (2) In MAINVIEW VistaPoint, combination of workloads to enable display of their transaction performance data in a single view.

**application trace.** *See* trace.

**ASCH workload.** Workload comprising Advanced Program-to-Program Communication (APPC) address spaces.

**AutoCustomization.** Online facility for customizing the installation of products. AutoCustomization provides an ISPF panel interface that both presents customization steps in sequence and provides current status information about the progress of the installation.

**automatic screen update.** Usage mode wherein the currently displayed screen is refreshed automatically with new data at an interval you specify. Invoked by the ASU command.

## B

**batch workload.** Workload consisting of address spaces running batch jobs.

**BBI.** Basic architecture that distributes work between workstations and multiple OS/390 targets for BMC Software MAINVIEW products.

**BBI-SS PAS.** *See* BBI subsystem product address space.

**BBI subsystem product address space (BBI-SS PAS).** OS/390 subsystem address space that manages communication between local and remote systems and that contains one or more of the following products:

- Command MQ for S/390
- MAINVIEW AutoOPERATOR
- MAINVIEW for CICS
- MAINVIEW for DB2
- MAINVIEW for DBCTL
- MAINVIEW for IMS Online
- MAINVIEW for MQSeries
- MAINVIEW VistaPoint (for CICS, DB2, DBCTL, and IMS workloads)

**BBPARM.** *See* parameter library.

**BBPROC.** *See* procedure library.

**BBPROF.** *See* profile library.

**BBSAMP.** See sample library.

**BBV.** See MAINVIEW Alternate Access.

**BBXS.** BMC Software Subsystem Services. Common set of service routines loaded into common storage and used by several BMC Software MAINVIEW products.

**border.** Visual indication of the boundaries of a window.

**bottleneck analysis.** Process of determining which resources have insufficient capacity to provide acceptable service levels and that therefore can cause performance problems.

## C

**CA-Disk.** Data management system by Computer Associates that replaced the DMS product.

**CAS.** Coordinating address space. One of the address spaces used by the MAINVIEW windows environment architecture. The CAS supplies common services and enables communication between linked systems. Each OS/390 image requires a separate CAS. Cross-system communication is established through the CAS using VTAM and XCF communication links.

**CFMON.** See coupling facility monitoring.

**chart.** Display format for graphical data. See also graph.

**CICSplex.** User-defined set of one or more CICS systems that are controlled and managed as a single functional entity.

**CMF MONITOR.** Comprehensive Management Facility MONITOR. Product that measures and reports on all critical system resources, such as CPU, channel, and device usage; memory, paging, and swapping activity; and workload performance.

**CMF MONITOR Analyzer.** Batch component of CMF MONITOR that reads the SMF user and 70 series records created by the CMF MONITOR Extractor and/or the RMF Extractor and formats them into printed system performance reports.

**CMF MONITOR Extractor.** Component of CMF that collects performance statistics for CMF MONITOR Analyzer, CMF MONITOR Online, MAINVIEW for OS/390, and RMF postprocessor. See CMF MONITOR Analyzer, CMF MONITOR Online, MAINVIEW for OS/390.

**CMF MONITOR Online.** Component of CMF that uses the MAINVIEW window interface to present data on all address spaces, their use of various system resources, and the delays that each address space incurs while waiting for access to these resources. See CMF MONITOR, MAINVIEW for OS/390.

**CMF Type 79 API.** Application programming interface, provided by CMF, that provides access to MAINVIEW SMF-type 79 records.

**CMFMON.** Component of CMF MONITOR that simplifies online retrieval of information about system hardware and application performance and creates MAINVIEW SMF-type 79 records.

The CMFMON *online facility* can be used to view data in one or more formatted screens.

The CMFMON *write facility* can be used to write collected data as MAINVIEW SMF-type 79 records to an SMF or sequential data set.

**CMRDETL.** MAINVIEW for CICS data set that stores detail transaction records (type 6E) and abend records (type 6D). Detail records are logged for each successful transaction. Abend records are written when an abend occurs. Both records have the same format when stored on CMRDETL.

**CMRSTAT.** MAINVIEW for CICS data set that stores both CICS operational statistic records, at 5-minute intervals, and other records, at intervals defined by parameters specified during customization (using CMRSOPT).

**column.** Vertical component of a view or display, typically containing fields of the same type of information, that varies by the objects associated in each row.

**collection interval.** Length of time data is collected. See also delta mode, total mode.

**command delimiter.** Special character, usually a ; (semicolon), used to stack commands typed concurrently on the COMMAND line for sequential execution.

**COMMAND line.** Line in the control area of the display screen where primary commands can be typed. Contrast with line command column.

**Command MQ Automation D/S.** Command MQ agents, which provide local proactive monitoring for both MQSeries and MSMQ (Microsoft message queue manager). The Command MQ agents operate at the local node level where they continue to perform functions regardless of the availability of the MQM (message queue manager) network. Functionality includes automatic monitoring and restarts of channels, queue managers, queues and command servers. In cases where automated recovery is not possible, the agents transport critical alert information to a central console.

**Command MQ Automation S/390.** Command MQ component, which monitors the MQM (message queue manager) networks and intercedes to perform corrective actions when problems arise. Solutions include:

- Dead-Letter Queue management
- System Queue Archival
- Service Interval Performance solutions
- Channel Availability

These solutions help ensure immediate relief to some of the most pressing MQM operations and performance problems.

**Command MQ for D/S.** Command MQ for D/S utilizes a true client/server architecture and employs resident agents to provide configuration, administration, performance monitoring and operations management for the MQM (message queue manager) network.

**Command MQ for S/390.** See MAINVIEW for MQSeries.

**COMMON STORAGE MONITOR.** Component of MAINVIEW for OS/390 that monitors usage and reconfigures OS/390 common storage blocks.

**composite workload.** Workload made up of a WLM workload or other workloads, which are called *constituent workloads*.

**constituent workload.** Member of a composite workload. Constituent workloads in a composite usually belong to a single workload class, but sometimes are mixed.

**contention.** Occurs when there are more requests for service than there are servers available.

**context.** In a Plex Manager view, field that contains the name of a target or group of targets specified with the CONTEXT command. See scope, service point, SSI context, target context.

**CONTEXT command.** Specifies either a MAINVIEW product and a specific target for that product (see target context) or a MAINVIEW product and a name representing one or more targets (see *SSI context*) for that product.

**control statement.** (1) Statement that interrupts a sequence of instructions and transfers control to another part of the program. (2) Statement that names samplers and other parameters that configure the MAINVIEW components to perform specified functions. (3) In CMF MONITOR, statement in a parameter library member used to identify a sampler in the extractor or a report in the analyzer, or to describe either component's processing requirements to the operating system.

**coupling facility monitoring (CFMON).** Coupling facility views that monitor the activity of your system's coupling facilities.

**CPO.** Customized Product Offering. Delivery and installation technique that allows any combination of BMC Software SMP/E-maintainable products to be distributed on a product tape to a customer and installed quickly. The CPO product tape contains libraries required for product customization and execution, plus SMP distribution libraries and data sets needed for application of SMP maintenance.

**current data.** Data that reflects the system in its current state. The two types of current data are realtime data and interval data. Contrast with historical data. See also interval data and realtime data.

**current window.** In the MAINVIEW window environment, window where the main dialog with the application takes place. The current window is used as the default window destination for commands issued on the COMMAND line when no window number is specified. Contrast with alternate window. See active window, window.

## D

**DASD.** Direct Access Storage Device. (1) A device with rotating recording surfaces that provides immediate access to stored data. (2) Any device that responds to a DASD program.

**DASD ADVISOR.** An interactive software tool that diagnoses DASD performance problems and makes recommendations to reduce overall service time. This tool measures and reports on the operational performance of IBM and IBM-compatible devices.

**data collector.** Program that belongs to a MAINVIEW product and that collects data from various sources and stores the data in records used by views. For example, MAINVIEW for OS/390 data collectors obtain data from OS/390 services, OS/390 control blocks, CMF MONITOR Extractor control blocks, and other sources. Contrast with extractor.

**delta mode.** (1) In MAINVIEW for DB2 analyzer displays, difference between the value sampled at the start of the current statistics interval and the value sampled by the current analyzer request. See also *statistics interval*. (2) In CMFMON, usage mode wherein certain columns of data reflect the difference in values between one sample cycle and the next. Invoked by the DELTA ON command. See also collection interval, sample cycle, total mode.

**DFSMS.** (Data Facility Storage Management System) Data management, backup, and HSM software from IBM for OS/390 mainframes.

**DMR.** See MAINVIEW for DB2.

**DMS.** (Data Management System) See CA-Disk.

**DMS2HSM.** Component of MAINVIEW SRM that facilitates the conversion of CA-Disk, formerly known as DMS, to HSM.

**DSO.** Data Set Optimizer. CMF MONITOR Extractor component that uses CMF MONITOR Extractor data to produce reports specifying the optimal ordering of data sets on moveable head devices.

## E

**EasyHSM.** Component of MAINVIEW SRM that provides online monitoring and reporting to help storage managers use DFHSM efficiently.

**EasyPOOL.** Component of MAINVIEW SRM that provides control over data set allocation and enforcement of allocation and naming standards. EasyPOOL functions operate at the operating system level to intercept normal job processing, thus providing services without any JCL changes.

**EasySMS.** Component of MAINVIEW SRM that provides tools that aid in the conversion of DFSMS and provides enhancements to the DFSMS environment after implementation. EasySMS consists of the EasyACS functions, the SMSACSTE function, and the Monitoring and Positioning Facility.

**element.** (1) Data component of a data collector record, shown in a view as a field. (2) Internal value of a field in a view, used in product functions.

**element help.** Online help for a field in a view. The preferred term is *field help*.

**Enterprise Storage Automation.** Component of MAINVIEW SRM that integrates powerful event management technology and storage monitoring technology to provide significant storage automation capabilities and solutions. Storage occurrences are defined to generate events in the form of messages that provide an early warning system for storage problems and are routed to MAINVIEW AutoOPERATOR to be viewed.

**Event Collector.** Component for MAINVIEW for IMS Online, MAINVIEW for IMS Offline, and MAINVIEW for DBCTL that collects data about events in the IMS environment. This data is required for Workload Monitor and optional for Workload Analyzer (except for the workload trace service). This data also is recorded as transaction records (X'FA') and program records (X'F9') on the IMS system log for later use by the MAINVIEW for IMS Offline components: Performance Reporter and Transaction Accountant.

**expand.** Predefined link from one display to a related display. *See also* hyperlink.

**extractor.** Program that collects data from various sources and keeps the data control blocks to be written as records. Extractors obtain data from services, control blocks, and other sources. *Contrast with* data collector.

**extractor interval.** *See* collection interval.

## F

**fast path.** Predefined link between one screen and another. To use the fast path, place the cursor on a single value in a field and press Enter. The resulting screen displays more detailed information about the selected value. *See also* hyperlink.

**field.** Group of character positions within a screen or report used to type or display specific information.

**field help.** Online help describing the purpose or contents of a field on a screen. To display field help, place the cursor anywhere in a field and press PF1 (HELP). In some products, field help is accessible from the screen help that is displayed when you press PF1.

**filter.** Selection criteria used to limit the number of rows displayed in a view. Data that does not meet the selection criteria is not displayed. A filter is composed of an element, an operator, and an operand (a number or character string). Filters can be implemented in view customization, through the PARM/QPARM commands, or through the Where/QWhere commands. Filters are established against elements of data.

**fixed field.** Field that remains stationary at the left margin of a screen that is scrolled either right or left.

**FOCAL POINT.** MAINVIEW product that displays a summary of key performance indicators across systems, sites, and applications from a single terminal.

**form.** One of two constituent parts of a view; the other is query. A form defines how the data is presented; a query identifies the data required for the view. *See also* *query*, *view*.

**full-screen mode.** Display of a MAINVIEW product application or service on the entire screen. There is no window information line. *Contrast with* windows mode.

## G

**global command.** Any MAINVIEW window interface command that can affect all windows in the window area of a MAINVIEW display.

**graph.** Graphical display of data that you select from a MAINVIEW window environment view. *See also* chart.

## H

**hilevel.** For MAINVIEW products, high-level data set qualifier required by a site's naming conventions.

**historical data.** (1) Data that reflects the system as it existed at the end of a past recording interval or the duration of several intervals. (2) Any data stored in the historical database and retrieved using the TIME command. *Contrast with* current data, interval data and realtime data.

**historical database.** Collection of performance data written at the end of each installation-defined recording interval and containing up to 100 VSAM clusters. Data is extracted from the historical database with the TIME command. *See* historical data.

**historical data set.** In MAINVIEW products that display historical data, VSAM cluster file in which data is recorded at regular intervals.

**HSM.** (Hierarchical Storage Management) Automatic movement of files from hard disk to slower, less-expensive storage media. The typical hierarchy is from magnetic disk to optical disk to tape.

**hyperlink.** (1) Preset field in a view or an EXPAND line on a display that permits you to

- Access cursor-sensitive help
- Issue commands
- Link to another view or display

The transfer can be either within a single product or to a related display/view in a different MAINVIEW product. Generally, hyperlinked fields are highlighted. (2) Cursor-activated short path from a topic or term in online help to related information. *See also* fast path.

## I

**Image log.** Collection of screen-display records. Image logs may be created for both the BBI-SS PAS and the BBI terminal session (TS).

The BBI-SS PAS Image log consists of two data sets that are used alternately: as one fills up, the other is used. Logging to

the BBI-SS PAS Image log stops when both data sets are filled and the first data set is not processed by the archive program.

The TS Image log is a single data set that wraps around when full.

**IMSplex System Manager (IPSM).** MVIMS Online and MVDBC service that provides Single System Image views of resources and bottlenecks for applications across one or more IMS regions and systems.

**interval data.** Cumulative data collected during a collection interval. Intervals usually last from 15 to 30 minutes depending on how the recording interval is specified during product customization. *Contrast with* historical data.

**Note:** If change is made to the workloads, a new interval will be started.

*See also* current data and realtime data.

**InTune.** Product for improving application program performance. It monitors the program and provides information used to reduce bottlenecks and delays.

**IRUF.** IMS Resource Utilization File (IRUF). IRUFs can be either detailed (one event, one record) or summarized (more than one event, one record). A detailed IRUF is created by processing the IMS system log through a program called IMFLEDIT. A summarized IRUF is created by processing one or more detailed IRUFs, one or more summarized IRUFs, or a combination of both, through a sort program and the TASCOSTR program.

## J

**job activity view.** Report about address space consumption of resources. *See* view.

**journal.** Special-purpose data set that stores the chronological records of operator and system actions.

**Journal log.** Collection of messages. Journal logs are created for both the BBI-SS PAS and the BBI terminal session (TS).

The BBI-SS PAS Journal log consists of two data sets that are used alternately: as one fills up, the other is used. Logging to the BBI-SS PAS Journal log stops when both data sets are filled and the first data set is not being processed by the archive program.

The TS Journal log is a single data set that wraps around when full.

## L

**line command.** Command that you type in the line command column in a view or display. Line commands initiate actions that apply to the data displayed in that particular row.

**line command column.** Command input column on the left side of a view or display. *Contrast with* COMMAND line.

**Log Edit.** In the MAINVIEW for IMS Offline program named IMFLEDIT, function that extracts transaction (X'FA')

and program (X'F9') records from the IMS system log. IMFLEDIT also extracts certain records that were recorded on the system log by IMS. IMFLEDIT then formats the records into a file called the IMS Resource Utilization File (IRUF).

## M

**MAINVIEW.** BMC Software integrated systems management architecture.

**MAINVIEW Alarm Manager.** In conjunction with other MAINVIEW products, notifies you when an exception condition occurs. MAINVIEW Alarm Manager is capable of monitoring multiple systems simultaneously, which means that MAINVIEW Alarm Manager installed on one system keeps track of your entire SYSPLEX. You can then display a single view that show exceptions for all MAINVIEW performance monitors within your OS/390 enterprise.

**MAINVIEW Alternate Access.** Enables MAINVIEW products to be used without TSO by providing access through EXCP and VTAM interfaces.

**MAINVIEW AutoOPERATOR.** Product that uses tools, techniques, and facilities to automate routine operator tasks and provide online performance monitoring, and that achieves high availability through error minimization, improved productivity, and problem prediction and prevention.

**MAINVIEW control area.** In the MAINVIEW window environment, first three lines at the top of the view containing the window information line and the COMMAND, SCROLL, CURR WIN, and ALT WIN lines. The control area cannot be customized and is part of the information display. *Contrast with* MAINVIEW display area, MAINVIEW window area.

**MAINVIEW display area.** *See* MAINVIEW window area.

**MAINVIEW Explorer.** Product that provides access to MAINVIEW products from a Web browser running under Windows. MAINVIEW Explorer replaces MAINVIEW Desktop.

**MAINVIEW for CICS.** Product (formerly MV MANAGER for CICS) that provides realtime application performance analysis and monitoring for CICS system management.

**MAINVIEW for DB2.** Product (formerly MV MANAGER for DB2) that provides realtime and historical application performance analysis and monitoring for DB2 subsystem management.

**MAINVIEW for DBCTL.** Product (formerly MV MANAGER for DBCTL) that provides realtime application performance analysis and monitoring for DBCTL management.

**MAINVIEW for IMS (MVIMS) Offline.** Product with a Performance Reporter component that organizes data and prints reports used to analyze IMS performance and a Transaction Accountant component that produces cost accounting and user charge-back records and reports.

**MAINVIEW for IMS (MVIMS) Online.** Product that provides realtime application performance analysis and monitoring for IMS management.

**MAINVIEW for IP.** Product that monitors OS/390 mission-critical application performance as it relates to IP stack usage. Collected data includes: connections, response time statistics, application availability, application throughput, and IP configuration.

**MAINVIEW for MQSeries.** Delivers comprehensive capabilities for configuration, administration, performance monitoring and operations management for an entire MQM (message queue manager) network.

**MAINVIEW for OS/390.** System management application (formerly MAINVIEW for MVS (prior to version 2.5)). Built upon the MAINVIEW window environment architecture, it uses the window interface to provide access to system performance data and other functions necessary in the overall management of an enterprise.

**MAINVIEW for UNIX System Services.** System management application that allows you to monitor the performance of the Unix System Services from a MAINVIEW window interface.

**MAINVIEW for VTAM.** Product that displays application performance data by application, transaction ID, and LU name. This collected data includes: connections, response time statistics, application availability, and application throughput.

**MAINVIEW for WebSphere.** Product that provides Web monitoring and management for applications integrated with IBM's WebSphere Application Server for OS/390.

**MAINVIEW Selection Menu.** ISPF selection panel that provides access to all MAINVIEW windows-mode and full-screen mode products.

**MAINVIEW Storage Resource Manager (SRM).** Suite of products that assist in all phases of OS/390 storage management. MAINVIEW SRM consists of components that perform automation, reporting, trend analysis, and error correction for storage management in OS/390.

**MAINVIEW SYSPROG Services.** *See* SYSPROG Services.

**MAINVIEW VistaPoint.** Product that provides enterprise-wide views of performance. Application and workload views are available for CICS, DB2, DBCTL, IMS, and OS/390. Data is summarized at the level of detail needed; e.g., reports may be for a single target, an OS/390 image, or an entire enterprise.

**MAINVIEW window area.** Portion of the information display that is not the control area and in which views are displayed and windows opened. It includes all but the first three lines of the information display. *Contrast with* MAINVIEW control area.

**monitor.** Online service that measures resources or workloads at user-defined intervals and issues warnings when user-defined thresholds are exceeded.

**MV MANAGER for CICS.** *See* MAINVIEW for CICS.

**MV MANAGER for DB2.** *See* MAINVIEW for DB2.

**MVALARM.** *See* MAINVIEW Alarm Manager.

**MVCICS.** *See* MAINVIEW for CICS.

**MVDB2.** *See* MAINVIEW for DB2.

**MVDBC.** *See* MAINVIEW for DBCTL.

**MVIMS.** *See* MAINVIEW for IMS.

**MVMQ.** *See* MAINVIEW for MQSeries

**MVMVS.** *See* MAINVIEW for OS/390.

**MVScope.** MAINVIEW for OS/390 application that traces both CPU usage down to the CSECT level and I/O usage down to the channel program level.

**MVSRM.** *See* MAINVIEW Storage Resource Manager (SRM).

**MVSRMHSM.** *See* EasyHSM.

**MVSRMSGC.** *See* SG-Control.

**MVSRMSGD.** *See* StorageGUARD.

**MVSRMSGP.** *See* StorageGUARD.

**MVVP.** *See* MAINVIEW VistaPoint.

**MVVTAM.** *See* MAINVIEW for VTAM.

**MVWEB.** *See* MAINVIEW for WebSphere.

## N

**nested help.** Multiple layers of help pop-up windows. Each successive layer is accessed by hyperlinking from the previous layer.

## O

**object.** Anything you can manipulate as a single unit. MAINVIEW objects can be any of the following: product, secondary window, view, row, column, or field.

You can issue an action against an object by issuing a line command in the line command column to the left of the object. *See* action.

**OMVS workload.** Workload consisting of OS/390 OpenEdition address spaces.

**online help.** Help information that is accessible online.

**OS/390 and z/OS Installer.** BMC Software common installation system for mainframe products.

**OS/390 product address space (PAS).** Address space containing OS/390 data collectors, including the CMF MONITOR Extractor. Used by MAINVIEW for OS/390.

MAINVIEW for USS, and CMF MONITOR products. *See* PAS.

## P

**parameter library.** Data set comprised of members containing parameters for specific MAINVIEW products or a support component. There can be several versions:

- The distributed parameter library, called BBPARAM
- A site-specific parameter library or libraries

These can be

- A library created by AutoCustomization, called UBBPARAM
- A library created manually, with a unique name

**PAS.** Product address space. Used by the MAINVIEW products. Contains data collectors and other product functions. *See* OS/390 product address space (PAS), BBI subsystem product address space (BBI-SS PAS).

**performance group workload.** MVS/SP-defined collection of address spaces. *See* service class workload, workload definition.

**PERFORMANCE MANAGER.** MAINVIEW for CICS online service for monitoring and managing current performance of CICS regions.

**Performance Reporter (MVIMS Offline).** MVIMS Offline component that organizes data and prints reports that can be used to analyze IMS performance.

**Performance Reporter.** Product component that generates offline batch reports. The following products can generate these reports:

- MAINVIEW for DB2
- MAINVIEW for CICS

**Plex Manager.** Product through which cross-system communication, MAINVIEW security, and an SSI context are established and controlled. Plex Manager is shipped with MAINVIEW window environment products as part of the coordinating address space (CAS) and is accessible as a menu option from the MAINVIEW Selection Menu.

**pop-up window.** Window containing help information that, when active, overlays part of the window area. A pop-up panel is displayed when you issue the HELP command.

**PRGP workload.** In MVS/SP 5.0 or earlier, or in compatibility mode in MVS/SP 5.1 or later, composite of service classes. MAINVIEW for OS/390 creates a performance group workload for each performance group defined in the current IEAIPSxx member.

**procedure library.** Data set comprised of members containing executable procedures used by MAINVIEW AutoOPERATOR. These procedures are execute command lists (EXECs) that automate site functions. There can be several versions:

- The distributed parameter library, called BBPROC
- A site-specific parameter library or libraries

These can be

- A library created by AutoCustomization, called UBBPROC
- A library created manually, with a unique name

The site-created EXECs can be either user-written or customized MAINVIEW AutoOPERATOR-supplied EXECs from BBPROC.

**product address space.** *See* PAS.

**profile library.** Data set comprised of members containing profile information and cycle refresh definitions for a terminal session connected to a BBI-SS PAS. Other members are dynamically created by MAINVIEW applications. There can be several versions:

- The distributed profile library, called BBPROF
- A site-specific profile library or libraries

These can be

- A library created by AutoCustomization, called SBBPROF
- A library created manually, with a unique name

The site library is a common profile shared by all site users. The terminal session CLIST creates a user profile automatically if one does not exist; it is called userid.BBPROF, where userid is your logon ID. User profile libraries allow each user to specify unique PF keys, CYCLE commands, target system defaults, a Primary Option Menu, and a unique set of application profiles.

## Q

**query.** One of two constituent parts of a view; the other is form. A query defines the data for a view; a form defines the display format. *See also* form, view.

## R

**realtime data.** Performance data as it exists at the moment of inquiry. Realtime data is recorded during the smallest unit of time for data collection. *Contrast with* historical data. *See also* current data and interval data.

**Resource Analyzer.** Online realtime displays used to analyze IMS resources and determine which are affected by specific workload problems.

**Resource Monitor.** Online data collection services used to monitor IMS resources and issue warnings when defined utilization thresholds are exceeded.

**row.** (1) Horizontal component of a view or display comprising all the fields pertaining to a single device, address space, user, etc. (2) Horizontal component of a DB2 table consisting of a sequence of values, one for each column of the table.

**RxD2.** Product that provides access to DB2 from REXX. It provides tools to query the DB2 catalog, issue dynamic SQL, test DB2 applications, analyze EXPLAIN data, generate DDL or DB2 utility JCL, edit DB2 table spaces, perform security administration, and much more.

## S

**sample cycle.** Time between data samples.

For the CMF MONITOR Extractor, this is the time specified in the extractor control statements (usually 1 to 5 seconds).

For realtime data, the cycle is not fixed. Data is sampled each time you press Enter.

**sample library.** Data set comprised of members each of which contains one of the following:

- Sample JCL that can be edited to perform specific functions
- A macro that is referenced in the assembly of user-written services
- A sample user exit routine

There can be several versions:

- The distributed sample library, called BBSAMP
- A site-specific sample library or libraries

These can be

- A library created by AutoCustomization, called UBBSAMP
- A library created manually, with a unique name

**sampler.** Program that monitors a specific aspect of system performance. Includes utilization thresholds used by the Exception Monitor. The CMF MONITOR Extractor contains samplers.

**SBBPROF.** *See* profile library.

**scope.** Subset of an SSI context. The scope could be all the data for the context or a subset of data within the context. It is user- or site-defined. *See* SSI context, target.

**screen definition.** Configuration of one or more views that have been stored with the SAVEScr command and assigned a unique name. A screen includes the layout of the windows and the view, context, system, and product active in each window.

**selection view.** In MAINVIEW products, view displaying a list of available views.

**service class workload.** OS/390- or MAINVIEW for OS/390-defined collection of address spaces.

If you are running MVS Workload Manager (WLM) in goal mode, MAINVIEW for MVS creates a service class workload for each service class that you define through WLM definition dialogs.

If you are running MVS 4.3 or earlier, or MVS/SP 5.1 or later with WLM in compatibility mode, MVS creates a performance group workload instead of a service class. *See* performance group workload.

**service objective.** Workload performance goal, specified in terms of response time for TSO workloads or turnaround time for batch workloads. Performance group workloads can be measured by either objective. Composite workload service objectives consist of user-defined weighting factors assigned to each constituent workload. There are no OS/390-related measures of service for started task workloads.

**service point.** Specification, to MAINVIEW, of the services required to enable a specific product. Services may be actions, selectors, or views. Each target (e.g., CICS, DB2, or IMS, ) has its own service point.

The PLEX view lists all the defined service points known to the CAS to which the terminal session is connected.

**service request block (SRB).** Control block that represents a routine to be dispatched. SRB mode routines generally perform work for the operating system at a high priority. An SRB is similar to a task control block (TCB) in that it identifies a unit of work to the system. *See also* task control block.

**service select code.** Code entered to invoke analyzers, monitors, and general services. This code is also the name of the individual service.

**session.** Total period of time an address space has been active. A session begins when monitoring can be performed. If the product address space (PAS) starts after the job, the session starts with the PAS.

**SG-Auto.** Component of MAINVIEW SRM that provides early warning notification of storage anomalies and automated responses to those anomalies based on conditions in the storage subsystem.

**SG-Control.** Component of MAINVIEW SRM that provides real-time monitoring, budgeting, and control of DASD space utilization.

**single system image (SSI).** Feature of the MAINVIEW window environment architecture that allows you to view and perform actions on multiple OS/390 systems as though they were a single system. The rows of a single tabular view can contain rows from different OS/390 images.

**SRB.** *See* service request block.

**SSI.** *See* single system image.

**SSI context.** Name created to represent one or more targets for a given product. *See* context, target.

**started task workload.** Address spaces running jobs that were initiated programmatically.

**statistics interval.** For MAINVIEW for DB2, cumulative count within a predefined interval (30-minute default set by the DB2STATS parameter in the distributed BBPARM member BBIISP00) for an analyzer service DELTA or RATE display. Specifying the DELTA parameter displays the current value as the difference between the value sampled by the current analyzer request and the value sampled at the start of the current interval. Specifying the RATE parameter displays the current value by minute (DELTA divided by the number of elapsed minutes).

**StopX37/II.** Component of MAINVIEW SRM that provides enhancements to OS/390 space management, reducing the incidence of space-related processing problems. The StopX37/II functions operate at the system level to intercept abend conditions or standards violations, thus providing services without any JCL changes.

**StorageGUARD.** Component of MAINVIEW SRM that monitors and reports on DASD consumption and provides historical views to help control current and future DASD usage.

**summary view.** View created from a tabular view using the Summarize option in view customization. A summary view compresses several rows of data into a single row based on the summarize criteria.

**SYSPROG services.** Component of MAINVIEW for OS/390. Over 100 services that detect, diagnose, and correct OS/390 system problems as they occur. Accessible from the OS/390 Performance and Control Main Menu. Note that this is also available as a stand-alone product MAINVIEW SYSPROG Services.

**system resource.** *See* object.

## T

**target.** Entity monitored by one or more MAINVIEW products, such as an OS/390 image, IMS or DB2 subsystem, CICS region, or related workloads across systems. *See* context, scope, SSI context.

**target context.** Single target/product combination. *See* context.

**TASCOSTR.** MAINVIEW for IMS Offline program that summarizes detail and summary IMS Resource Utilization Files (IRUFs) to be used as input to the offline components.

**task control block (TCB).** Address space-specific control block that represents a unit of work that is dispatched in the address space in which it was created. *See also* service request block.

**TCB.** *See* task control block.

**terminal session (TS).** Single point of control for MAINVIEW products, allowing data manipulation and data display and providing other terminal user services for MAINVIEW products. The terminal session runs in a user

address space (either a TSO address space or a standalone address space for EXCP/VTAM access).

**TDIR.** *See* trace log directory.

**threshold.** Specified value used to determine whether the data in a field meets specific criteria.

**TLDS.** *See* trace log data set.

**total mode.** Usage mode in CMFMON wherein certain columns of data reflect the cumulative value between collection intervals. Invoked by the DELTA OFF command. *See also* collection interval, delta mode.

**trace.** (1) Record of a series of events chronologically listed as they occur. (2) Online data collection and display services that track transaction activity through DB2, IMS, or CICS.

**trace log data set (TLDS).** Single or multiple external VSAM data sets containing summary or detail trace data for later viewing or printing. The trace log(s) can be defined as needed or dynamically allocated by the BBI-SS PAS. Each trace request is assigned its own trace log data set(s).

**trace log directory (TDIR).** VSAM linear data set containing one entry for each trace log data set. Each entry indicates the date and time of data set creation, the current status of the data set, the trace target, and other related information.

**transaction.** Specific set of input data that initiates a predefined process or job.

**Transaction Accountant.** MVIMS Offline component that produces cost accounting and user charge-back records and reports.

**TS.** *See* terminal session.

**TSO workload.** Workload that consists of address spaces running TSO sessions.

## U

**UAS.** *See* user address space.

**UBBPARM.** *See* parameter library.

**UBBPROC.** *See* procedure library.

**UBBSAMP.** *See* sample library.

**user address space.** Runs a MAINVIEW terminal session (TS) in TSO, VTAM, or EXCP mode.

**User BBPROF.** *See* profile library.

## V

**view.** Formatted data within a MAINVIEW window, acquired from a product as a result of a view command or action. A view consists of two parts: query and form. *See also* form, job activity view, query.

**view definition.** Meaning of data that appears online, including source of data, selection criteria for data field inclusion and placement, data format, summarization, context, product, view name, hyperlink fields, and threshold conditions.

**view command.** Name of a view that you type on the COMMAND line to display that view.

**view command stack.** Internal stack of up to 10 queries. For each command, the stack contains the filter parameters, sort order, context, product, and timeframe that accompany the view.

**view help.** Online help describing the purpose of a view. To display view help, place the cursor on the view name on the window information line and press PF1 (HELP).

## W

**window.** Area of the MAINVIEW screen in which views and resources are presented. A window has visible boundaries and can be smaller than or equal in size to the MAINVIEW window area. *See* active window, alternate window, current window, MAINVIEW window area.

**window information line.** Top border of a window. Shows the window identifier, the name of the view displayed in the window, the system, the scope, the product reflected by the window, and the timeframe for which the data in the window is relevant. *See also* window status field.

**window number.** Sequential number assigned by MAINVIEW to each window when it is opened. The window number is the second character in the window status field. *See also* window status field.

**window status.** One-character letter in the window status field that indicates when a window is ready to receive commands, is busy processing commands, is not to be updated, or contains no data. It also indicates when an error has occurred in a window. The window status is the first character in the window status field. *See also* window information line, window status field.

**window status field.** Field on the window information line that shows the current status and assigned number of the window. *See also* window number, window status.

**windows mode.** Display of one or more MAINVIEW product views on a screen that can be divided into a maximum of 20 windows. A window information line defines the top border of each window. *Contrast with* full-screen mode.

**WLM workload.** In goal mode in MVS/SP 5.1 and later, a composite of service classes. MAINVIEW for OS/390 creates a workload for each WLM workload defined in the active service policy.

**workflow.** Measure of system activity that indicates how efficiently system resources are serving the jobs in a workload.

**workload.** (1) Systematic grouping of units of work (e.g., address spaces, CICS transactions, IMS transactions) according to classification criteria established by a system

administrator. (2) In OS/390, group of service classes within a service definition.

**workload activity view.** Tracks workload activity as the workload accesses system resources. A workload activity view measures workload activity in terms of resource consumption and how well the workload activity meets its service objectives.

**Workload Analyzer.** Online data collection and display services used to analyze IMS workloads and determine problem causes.

**workload definition.** Workload created through the WKLIST view. Contains a unique name, a description, an initial status, a current status, and selection criteria by which address spaces are selected for inclusion in the workload. *See* Workload Definition Facility.

**Workload Definition Facility.** In MAINVIEW for OS/390, WKLIST view and its associated dialogs through which workloads are defined and service objectives set.

**workload delay view.** Tracks workload performance as the workload accesses system resources. A workload delay view measures any delay a workload experiences as it contends for those resources.

**Workload Monitor.** Online data collection services used to monitor IMS workloads and issue warnings when defined thresholds are exceeded.

**workload objectives.** Performance goals for a workload, defined in WKLIST. Objectives may include measures of performance such as response times and batch turnaround times.
