**Rule DAS270:        THERE DID NOT APPEAR TO BE A PROBLEM WITH VOLUME PERFORMANCE**

---

**Finding:**        The performance of the volume having the "worst" overall performance was not poor in any area evaluated by CPEXpert.

**Impact:**        This finding has little impact, other than to indicate that there may be no problem with the device.

**Logic flow:**    The following rules cause this rule to be invoked:  
                          DAS200: Volume with worst overall performance

**Discussion:**    CPEXpert checked seek time, missed RPS reconnect time, PEND time, CONN time, missed cache hits, and IOSQ time. None of these areas accounted for the delay for the volume selected as the volume with the "worst" overall performance.

**Suggestion:**    This condition most likely would occur when the guidance provided to CPEXpert is too restrictive. For example, if a large number of volumes are excluded from analysis (using the EXCLUDE option), the remaining volumes may have no particular problem. However, the logic is designed to select a "worst" volume, regardless of whether that volume actually has problems.
