

# LOCAL : Local Nucleus

| Parameter | Specify . . .   | Possible Values | Default |
|-----------|---|-----------------|---------|
| LOCAL     | whether a nucleus is isolated and available for local use only. | YES   NO        | YES     |

Defines an isolated nucleus that is only available locally. The nucleus is unknown to Entire Net-Work. A nucleus specifying LOCAL=YES (the default) can have the same database ID as another database nucleus on another network node.

| Value | Meaning   |
|-------|---|
| YES   | Isolates this nucleus (that is, makes it unaddressable) from other Entire Net-Work nodes. |
| NO    | Allows the nucleus to receive calls from other Entire Net-Work nodes.                     |

## Example:

The Adabas nucleus is isolated and can not be addressed by other Entire Net-Work nodes.

```
ADARUN PROG=ADANUC,LOCAL=YES
```
