

# QBLKSIZE : Block Size for Sequential Datasets

Parameter	Specify . . .	Minimum	Maximum	Default
QBLKSIZE	the block size for sequential datasets used by ADAIOR.	0	262144	0 (see text)

QBLKSIZE specifies the block size, in bytes, for the sequential datasets used by ADAIOR, the Adabas I/O component. Use this parameter to override the default block sizes.

### Warning:

**If you choose to write tape files with large block sizes, for example for database backups, these files will not be transportable to systems where support for large blocks is not available. This might include a site being used as a backup facility for disaster recovery.**

If QBLKSIZE=0 (the default), the following default block sizes are used:

#### Dataset    Block Size

Tape        the optimum selected for the device by the operating system

CKD-Disk track-size / k, where k = smallest value such that track-size / k <= 32760

FBA-Disk 32760

Under all operating systems except VSE/ESA, this block size may be provided in the JCL or dataset label.

Under BS2000, disk block sizes are always rounded up to the next integer multiple of 2048 bytes.

### Example:

During this Adabas session, use a block size of 20,000 bytes for the Adabas sequential datasets.

```
ADARUN PROG=ADANUC,QBLKSIZE=20000
```
