

Navigating Through the Teleservices Functions

When Con-nect Teleservices is installed at your site, you can define telex, teletex or telefax nodes.

In order to permit a user to use a selectable unit, you must ensure that the Send External Mail function is permitted in the user's profile. See *Cabinet and User Profile*.

Note:

During the transmission of telex/teletex/telefax items records are written to the spool file. These records must be deleted from the Con-nect spool file with the Delete Spool File Entries function on a regular basis. For further information, see *Delete Spool File Entries*.

The following diagram shows the path you must take to add and maintain telex, teletex, and telefax mail nodes.

The items which consist of functions applicable to *all* node types are displayed as light green boxes. For further information, see *External Mail Nodes*.
