

Front-end User Routines

Front-end user routines are coded as Natural subprograms and are invoked by the Entire Operations front end for specific processing.

They can use any user-defined map with the following restrictions:

- The map (Natural object, type M) must be accessible from the Entire Operations library SYSEOR. The easiest way is to copy the required maps into the Entire Operations library.
- Note that Entire Operations can be executed with the following Natural language codes: 1 = English; 2 = German. So it could be useful to supply two maps and to refer to them with the ampersand & as a placeholder representing the current language code. For more information on this technique, see the subsection **Multilingual User Interfaces** in the **Natural Programmer's Guide**.

You can define the following front-end user routine:

- Symbol prompting for a network or job activation. For more information, see the subsection Symbol Prompting during Manual Activation in the section Network Maintenance.
