

Re-generation of JCL for Sub-networks

The application of the line command **G** on a job of the NET type causes the (re-) activation of the sub-network to occur. However, it **does not** have the automatic start of the sub-network as a consequence. The sub-network will receive a **new run number** because of this action.

 **To start the sub-network after re-generation of the JCL**

- the line command **R** (Resubmit active job) must be entered (see Resubmitting Sub-networks).
