

General

You can define the run-time environment of your products in one or more Natural members in the SAT user library, SYSSATU. You can specify any member name except the 'main' member, which must conform to the following naming convention: SATP*nnn*, where *nnn* = Entire System Server node under which the SAT products are AUTO-Started.

In the 'main' member, you must specify all parameter values needed to start the products. An asterisk * in the first column denotes a comment line. Lines prefixed with SAT are treated as default values for SAT or Natural. They can be overwritten by product-specific values. This means that all occurrences of a parameter are merged when the product is started.

For each occurrence of a SATSTART entry a product server is started.

Note:

If Software AG's integrated application development tool Natural ISPF is installed at your site, you can use the SAT menu to perform this maintenance work and for logging on to any of Software AG's solutions in the Entire Systems Management product line. The SAT menu is provided in the SAT*nnn*.INPL data set.

To make this menu available within Natural ISPF's menu system, simply activate the SAT subsystem of Natural ISPF.

If you need further information, see the section System Configuration in the Natural ISPF Administration Documentation.
