

DD - Day Differential

This Natural profile parameter is for:

- Mainframes
- UNIX and Windows

It adjusts the current machine date (as read by using the internal machine time) by adding/subtracting any number of days to/from it. This makes it possible to re-run an application that was to be run at a certain date but for some reason could not be run at that date.

The DD profile parameter is specified as follows:

DD=+ <i>nn</i>

or

DD=- <i>nn</i>

where *nn* is the number of days.

Possible settings	Mainframes	UNIX and Windows	
	-32767 to +32767	-10953 to +10953	Machine date is adjusted. Specification of "+" is optional.
	0	0	No adjustment is made.
Default setting	0	0	
Dynamic specification	YES	YES	
Specification within session	NO	NO
