

EJ - Page Eject

This Natural profile and session parameter is for all platforms.

With this parameter, you specify whether a page eject is to be performed as a result of a logical page break, a break between program input and output, and the "normal end" message.

Within a Natural session, the profile parameter EJ can be overridden by the session parameter EJ. The EJ setting can in turn be overridden by an EJECT statement.

Possible settings	ON	A page eject is performed.		
	OFF	No page eject is performed. This setting may be used to save paper during test runs where page ejections are not needed.		
Default setting	ON			
Dynamic specification	YES			
Specification within session	YES	Applicable Statements:	SET GLOBALS	Parameter is evaluated at runtime.
		Applicable Command:	GLOBALS	Parameter may be specified dynamically with the GLOBALS system command.

This parameter only applies to the first report (Report 0). For additional reports, the **statement** EJECT with report specification (rep) has to be used.

Attention:

The **profile parameter** EJ has a slightly different meaning when specified for a Natural session under CICS in batch mode (for example, TTYPE=ASYL or TTYPE=BTCH); see Asynchronous Natural Processing under CICS in the Natural TP Monitor Interfaces documentation.
