

NUCNAME - Name of Shared Nucleus

This Natural profile parameter is for mainframes only.

With this parameter, you specify the name of the (environment-independent) Natural shared nucleus if it is to be loaded dynamically and not linked to the environment-dependent Natural nucleus.

See also Natural Shared Nucleus under OS/390 and VSE/ESA in the Natural Operations for Mainframes documentation.

Possible settings	1 to 8 characters	Valid load module name.
Default setting	none	
Dynamic specification	YES	By specifying this parameter dynamically, you are able to use different Natural shared nuclei (for example, for production and for testing) together with the same environment-dependent Natural nucleus without having to relink the nucleus.
Specification within session	NO	

The NUCNAME parameter is ignored if it is specified in a parameter string activated by a SYS or PROFILE profile parameter or in an alternative parameter module (as specified with the PARM profile parameter).
