

YD - Year Differential

This Natural profile parameter is for mainframes only.

It can be used to adjust the current machine date (as read by using the internal machine time) by adding/subtracting a number of years to/from it. This may be useful for countries that use different calendars.

Possible settings	-499 to 499	The parameter is specified as YD=+ <i>nnn</i> or YD=- <i>nnn</i> where <i>nnn</i> is the number of years.
Default setting	0	
Dynamic specification	YES	
Specification within session	NO	

Notes:

- If the current year is a leap year, but the year resulting from the YD setting is not, the 1st March will be used instead of the 29th February.
- The year resulting from the sum of the profile parameters TD, DD and YD must be in the range of 1583 through 2699.
