

Introducing System Commands

Natural system commands perform functions you need to create, maintain or execute Natural programming objects. In addition, Natural system commands are used to monitor and administer your Natural environment.

For an overview of the Natural system commands available, see [System Commands Grouped by Function](#).

System commands provide a key-based alternative to the menu-based means of issuing commands.

Single Point of Development: If you are using a remote development server, commands concerning the remote environment are issued under Windows, but both obtain information from and return information to the mainframe as required. If the command requires input or output from a mainframe screen, a terminal emulation window displaying the appropriate screen appears. Commands are executed locally wherever possible.

Note:

There is a difference between Natural system commands and Natural statements. System commands perform functions in a Natural session whereas statements are components of Natural programs.
