

MAIL

This command applies to all platforms. It is available only if Natural Security is installed.

```
MAIL mailbox-id
```

A mailbox is a kind of "notice board" used to broadcast messages, which is defined in Natural Security.

With the MAIL command, you can invoke a mailbox to modify its contents and/or expiration date. The *mailbox-id* you specify (maximum 8 characters) must be defined in Natural Security (see Mailboxes in the Natural Security documentation).
