

ROUTINES

This command is for Mainframes only.

ROUTINES

With this command, you can ascertain which objects in the current library use which external subroutines and classes.

All objects in the current library are listed along with the names of the external subroutines or classes they invoke, and the object names of the subroutines or classes in which the external subroutines or classes are contained.

If an object is itself a subroutine or class, the name of the subroutine or class it contains is displayed.
