

SYSPARM

This command is for Mainframes only.

SYSPARM

This command is used to invoke the SYSPARM utility. You use this utility to create and maintain strings of Natural profile parameters.

You can specify a string of parameters and store it under a profile name. You can then invoke Natural with the single dynamic parameter PROFILE by specifying:

`PROFILE=profile-name.`

The parameters defined in this profile are passed to Natural as dynamic parameters.

For further information on SYSPARM and additional syntactical items, see SYSPARM Utility described in the Natural Utilities documentation.
