

RPCERR

This command is for Mainframes only.

RPCERR

RPCERR displays the last Natural error number and message if it was RPC related, and it also displays the last BROKER reason code and associated message. Additionally, the node and server name from the last Broker call can be retrieved.

For further information, see the section *Monitoring the Status of an RPC Session* under *Operating a Natural RPC Environment* as described in the *Natural Remote Procedure Call (RPC) documentation*.
