

%I - Capture Current Screen

Note:

This command is not available with Natural for Windows.

Command Syntax

<code>%I</code>

When you enter this command on a screen, the screen will be captured by the NATPAGE screen paging function (NATPAGE utility).

The maximum number of screens that can be captured is determined by the session parameter PD. If this number is exceeded, each additional screen will overwrite one that has already been captured, beginning with the one captured first.

To display screens that have been captured with the screen paging function, use the terminal command %E.

See also the terminal commands %P, %O, %S, and %E.
