

%L - Disable Lower- to Upper-Case Translation

Command Syntax

%L

This command prevents that lower-case characters are translated to upper-case by Natural.

%L influences the interactive input, which is entered e.g. with a Natural INPUT statement. It does not, however, influence the input from the stack.

Natural for Mainframes:

You should also ensure that the TP monitor used does not perform any translation before data are passed to Natural.

See also the terminal command %U.
