

SYSERR - Loading Messages - ERRLODUS

The program ERRLODUS is used to load messages previously unloaded with the program ERRULDUS.

The messages are read from Work File 2 and are written to the FNAT or FUSER system file. ERRLODUS overwrites existing messages in the system file if Replace was specified as **Y** when unloading.

If you specify ERRLODUS as ON, a list of all messages that were loaded (added or replaced) is displayed when loading is complete.

Note:

Under Natural Security, the online use of ERRLODUS is only available for users of the type Administrator, regardless of the setting of the Utilities option in the security profile of the library. See also Utilities in Library Maintenance (General Options) in the Natural Security documentation.
