

RDACTIVE - Activate Remote Debugger

This Natural profile parameter is for UNIX/OpenVMS and Windows platforms only.

It specifies whether a remote debugger on a Windows NT computer is to be used or not. RDACTIVE is only relevant if the **system command** DEBUG has been used. It is used in combination with the profile parameters RDNODE (where the relevant node name is specified) and PDPORT (where the port number is specified).

Possible settings	ON	Remote debugging is enabled. If you specify RDACTIVE=ON on a DCOM or RPC server, the remote debugging session is opened automatically.
	OFF	UNIX/OpenVMS: No debugging is possible. Windows: Remote debugging is not possible. Local debugging can be performed.
Default setting	OFF	
Dynamic specification	YES	
Specification within session	NO
