

# PD - NATPAGE Page Dataset

**Note:**

This parameter is for Mainframes and UNIX/OpenVMS only.

Parameter	Possible Values	Default Value	Applicable Statements
PD	0 to 255	50	SET GLOBALS

This parameter is used to specify the maximum number of pages (screens) which can be recorded with the NATPAGE utility.

If this number is exceeded, each additional screen will overwrite an already recorded screen, thus gradually overwriting the oldest screens, i.e. those recorded first (wrap-around technique).

The recorded screens are stored in the Natural system file FUSER.

For further information on the NATPAGE utility, see the terminal commands %E, %I, %O, %P and %S.

**Example:**

```
SET GLOBALS PD=60
```
