

# CLEAR

- For Mainframes
- For UNIX/OpenVMS and Windows

## CLEAR for Mainframes

CLEAR

This command clears the source work area. This command can be used if a new program is to be created and there is another object in the source work area.

If this object has been modified since the last save, you are prompted to save any changes.

## **CLEAR for UNIX/OpenVMS and Windows**

**CLEAR**

The CLEAR command closes the currently active object and opens a new editor window without content and without a name. The type of editor is the same as the currently active object. If this object has been modified since the last save, you are prompted to save any changes.
