

# Introduction

This section contains the messages and codes returned by the Entire System Server, together with an explanation of the error text. Information concerning remedial action is also provided where appropriate.

Message codes are returned in the field `ERROR-CODE`, with an appropriate text describing the message in the field `ERROR-TEXT`. If neither of these fields appear in the user-supplied format buffer, and if an error occurs, the appropriate Natural error message (Range 5500 to 5999) is issued.

This document contains two sets of messages:

- System Messages describes the messages ESY5500 to ESY5999;
- Console Messages describes the messages with prefix XCO (XCO0009I to XCO2015E) and ESY0001I to ESY4018E.

## Notes:

1. The Entire System Server field `ERROR-CODE` (N3) contains only the last three 3 digits of the Natural error number.
2. Some error texts below contain variables indicated by *n*., where *n* denotes a value supplied by the Entire System Server as appropriate.
3. For some messages, this manual gives no explanation or remedial information. These messages will be used in future versions of the product.
