

# Data Transfer

You can transfer data between Natural applications on host systems and the PC using the different types of viewers that are provided with Entire Screen Builder, or using the XML Version.

This documentation is organized under the following headings:

- **General Data Transfer Information**      How to tell Natural that you are an Entire Screen Builder user, what data can be uploaded and downloaded, supported file and field formats, and how to abort data transfer.
- **Specifying a File Name**      How to upload and download data using a dialog box, how to specify a file name using the SET command, and how to create a file name dynamically.
- **Uploading and Downloading Data**      How the different types of data are uploaded and downloaded.

**Note:**

The Natural Connection data transfer module must be installed and enabled in Natural on the host system before it can be used. On mainframe platforms, the Natural Connection data transfer module is a separately licensed product.
