

Predict Administration - Overview

This documentation describes functions normally performed by the Predict administrator to customize and protect a Predict environment.

- Defaults Handling of Predict and the way Predict functions work can be customized with Predict default parameters.
- Special Functions Functions to administrate Predict.
- User Exits Predict functions can be customized using User Exits.
- Predict in Batch Mode An overview of the functions that can be executed in batch mode. Operating system specific information, such as workfiles and additional reports, is provided where required. How to start and finish a Predict/Natural session, and how to enter Predict commands. Sample commands are provided.
- Conversion Conversion of Predict data from Version 4.1.
- Metadata Administration The Predict metastructure (object and association type definitions) can be extended and modified. Retrieval models can be defined to specify precisely the amount of data to be retrieved from the Dictionary.
- Application Programming Interface The functions provided by the Application Programming Interface (API) enable direct read/write access to Predict objects of user-defined types.
