

Verification

Objects of type verification can contain code for processing rules. Verifications can have as status documented, conceptual, free, automatic, Natural Construct or SQL.

In the predefined Predict metastructure, verifications can have passive and active associations of the following types:

Valid passive associations: *Verifies EL*
Is comp. of SY

Valid active association: *No predefined association*

This section covers the following topics:

- Verification Maintenance Menu
- Verification-Specific Maintenance
- Verification-Specific Retrieval

Additional Information on Verifications/Processing Rules

- See the section Verifications and Processing Rules in the **Predict and Other Systems documentation**.
- The editor used to modify processing rules is described in the section Editors in Predict in the **Predict Reference documentation**.
- See also Rippling Verifications in the **Predefined Object Types in Predict documentation**.
