

# Spool Data Set and Report

A spool data set is identified as containing a Report if its Spool Attributes match the identification attributes of one or more Report definitions.

One complete spool data set can constitute a Report or it can be separated into smaller Reports.

To separate a spool data set into several Reports, you can use your own Natural User Routines or one of the Entire Output Management Standard Separation Routines. For more information on User Routines, see the Section Printer Exits, User Routines and Separator Pages in the System Programmer's Documentation.
