

Owner

Entire Operations provides ease of use and enhanced security through the concept of owners. This involves dividing job networks into groups by assigning them to an owner name. The system administrator assigns an owner name to a user ID in the User Maintenance facility (see the subsection User Maintenance in the the section System Administrator Services of the Entire Operations Administration Documentation). This owner name is automatically passed to the job network defined by the user.

An owner can thus represent a department or project, or a group of related job networks. Users belonging to a specific owner can perform functions only on those job networks associated with the same owner.

Note:

In special cases, a user can be authorized to access networks belonging to other owners. The owner SYSDBA is authorized to access the networks of all owners.

Any number of job networks can be associated with any one owner. A job network name is unique within the System only in combination with its owner name.

Access to most other Entire Operations entities is also owner-dependent. The owner name appears in the top line of most system screens and windows.

The figure below illustrates the links between users, owners and job networks:
