

# Routines to Set Input Conditions

Before Entire Operations can submit a job, all its input conditions must be fulfilled.

If a user routine is defined for the condition, Entire Operations invokes the defined routine when checking condition status. After execution, the routine returns a code which is compared with the condition code defined as desired value for the input condition. The condition is automatically set if the codes match. If the codes do not match, you find a user-defined text on the Active Jobs screen. You can define the text with the P-RT parameter.

For an example of a user routine to set an input condition, see the subsection Input Condition Maintenance in the section Job Maintenance.
