

Sysout Copy from UNIX / Windows NT to Mainframe

This subsection covers the following topics:

- Defining the Handover of Sysout Files from Unix or Windows NT to BS2000/OSD
- Field Descriptions: Sysout Copy from UNIX / Windows NT to Mainframe
- Special PF Keys: Sysout Copy from UNIX / Windows NT to Mainframe

Defining the Handover of Sysout Files from Unix or Windows NT to BS2000/OSD

▶ To define the handover of sysout files from Unix or Windows NT to BS2000/OSD

- Press PF9

The following window appears:

```

You can copy a UNIX or Windows NT sysout file to a BS2000/OSD system so that it can be handed over to the Output Management for instance.

The sysout node must differ from the execution node, and it must be a BS2000/OSD node.

The naming conventions for the copy is identical with the one for sysout files, which have been directly created on the mainframe. Even possibly present Exits for Sysout file names are run through). Sysout copies are affected by the automatic file cleanup just as the original sysout.

Please note that the application of this function means an additional working effort for the Entire Operations Monitor, which depends upon the number of the handovers and from the size of the sysout files.

Field Descriptions: Sysout Copy from UNIX / Windows NT to Mainframe

Field	Meaning
Sysout Node	a valid Entire System Server node on BS2000/OSD
Sysout Cat ID	BS2000/OSD Cat ID, which is to be used for the copied file (optional)
Sysout User ID	BS2000/OSD User ID, under which the copied sysout file is to be generated.

Special PF Keys: Sysout Copy from UNIX / Windows NT to Mainframe

Key	Name	Function
PF9	Delete	Delete all input fields
