

# Exchanging Active JCL

When modifying an active job, you can specify another JCL member and library by overtyping the current values in the corresponding input fields. This allows you to run a different job in place of the old one using the same input conditions, end-of-job handling, etc. The replacement is valid for the current network run only.

When you have specified a different JCL member and/or library, Entire Operations replaces the old JCL with the new and notifies you of the replacement with a message. The new member can use the Dynamic JCL Generation facility.

**Note:**

After exchanging the JCL, the job must be restarted with the line command **R** (repeat). For further information, see Resubmitting an Active Job.
