

# Regeneration or Generation of Active JCL

The JCL for operating system jobs is generated (copied to the active data base) when Entire Operations activates a job network. Entire Operations allows you to regenerate the JCL while the job is in the active data base. This is useful when you wish to refresh the variables in dynamically generated JCL in MAC-type jobs or when you wish to (re-)submit active jobs with their original JCL after editing their JCL for a specific job run.

Even if pregenerated JCL exists, this command regenerates the active JCL from the master JCL. Symbol values are taken in their current status from the active symbol table. If necessary, the active symbol table should be checked beforehand.

The (re-)generation of active JCL is always being performed online, i.e., not by the NOP Monitor. This also applies to MAC-type jobs.

## To regenerate JCL

1. Type **G** in the line command field of the selected job on the Active Jobs screen.
2. Press Enter.
3. A window opens in which you can confirm regeneration by entering **Y** (yes).
4. Press Enter to confirm the regeneration and close the window.
5. The message JCL regenerated for job appears in the message field of the selected job on the Active Jobs screen.
