

Application Programming Interface

The Entire Operations library contains an Application Programming Interface (API). This is a set of routines that you can invoke from any other Natural application in order to access Entire Operations' internal data.

You can invoke these routines simply by using a Natural CALLNAT statement. The CALLNAT statement is described in detail in the **Natural Reference Documentation**.

In an appropriate location after the CALLNAT statement, you must code an END TRANSACTION statement to close Entire Operations' transaction logic. No END TRANSACTION statement is issued from within Entire Operations' APIs.

You can change the parameter names, but not the parameter format, number and order.
