

Invoking the API Routines

First, the user application must establish a link to the Entire Operations system files. This can be done in any of the following ways:

If the user application startup is extended with either

```
NTFILE ID=216,DBID=<eor-sysf1-dbid>,FNR=<eor-sysf1-fnr>
NTFILE ID=131,DBID=<sat-log-dbid>,FNR=<sat-log-fnr> (in parameter module)
```

or

```
LFILE (216,<eor-sysf1-dbid>,<eor-sysf1-fnr>)
LFILE (131,<sat-log-dbid>,<sat-log-fnr>) (as dynamic parameter)
```

the link is already established.
