

Overview

This subsection tells you how to install or upgrade Entire System Server (abbreviation: NPR) on a Windows NT machine, and describes the parameters required for a successful startup of the product.

The method used for installation is a mixture of manual and automated functions which are executed in a simple, straightforward manner via shell scripts.

Before you begin, ensure that your computer meets the minimum hardware and software requirements as recommended below.

You must have access to the **root** account and be thoroughly familiar with the system generation process and all other system requirements. With reference to Entire Net-work or Entire Broker, it is also assumed that you have a fundamental knowledge of the Entire Net-work or Entire Broker administration.

For more information on how to install Software AG products, see the section Installation and Customization on UNIX Platforms.

Important:

Before installing and starting to operate the product, you must take into account the following information:

You need Windows NT **administrator rights** to perform the installation.
