

Selecting a Function or Object

Natural makes it easy for you to select a function or object by providing an extensive system of prompt windows.

- To select a function, simply enter an asterisk * in the command line of the current screen. This opens a window with available functions. Select one by entering it in the input field of the window;
- To select a function for a particular object type, simply enter the object type in the command line of any system screen. This opens a window with all available functions for the object type.

Note:

When requesting a list of functions for Natural objects, use the shortest possible abbreviation **N**. If you use NAT or Natural, it is interpreted as a logon request to Natural,

- To select an object for a particular function from the Main Menu, simply enter the function command in the command line of the Main Menu. This opens a window with available object types for the function.
