

# Confirmation Windows

When you wish to perform certain functions on a Natural object using function commands (e.g. DELETE, COMPRESS), a window is opened in which Natural asks you to confirm the function by entering the object name or **Y**. You can back out the request simply by leaving the input field in the window blank and pressing PF3.

You can suppress the confirmation feature with the command

```
CONFIRM OFF
```

for example when deleting objects from a list using multiple **D** line commands in a single input operation. The message CONFIRM OFF is displayed in the message line. The function is then performed without confirmation. The confirmation feature is automatically reactivated when you invoke another system screen, or you can issue one of the following commands:

```
CONFIRM LONG  
CONFIRM SHORT
```

where LONG specifies confirmation by name input and SHORT specifies confirmation by entering **Y** or **N** in the confirmation window.

The default is CONFIRM SHORT and can be modified in your user profile using the PROFILE option on the Natural Main Menu (see the subsection User Defaults in the section Profile Maintenance). See also the description of the CONFIRM session command in the section Command Reference.
