

ACIPATT - Define Node Pattern for ACI Protocol

This Natural profile parameter is for UNIX/OpenVMS and Windows platforms only.

Note for mainframes:

Use the keyword parameter ACIPATT of the NTRPC macro for static specification, or the subparameter with the same name of the profile parameter RPC.

This parameter determines which node names will be used for the ACI transport protocol together with Natural Remote Procedure Call. You can specify a pattern to match node names used for the ACI transport protocol (that is EntireX Broker nodes).

ACIPATT is specified on the client side only. It applies only to nodes which were defined in the server maintenance of the SYSRPC utility (because there the transport protocol cannot be specified).

Possible settings	1-8 characters, including *	Pattern for node name matching. All node names matching this pattern are assumed to be ACI nodes.
Default setting	*	All node names match the pattern. The ACI transport protocol is used for all of them.
Dynamic specification	YES	
Specification within session	YES	At runtime, this value can be overwritten by the parameter maintenance of the SYSRPC utility.

Node names beginning with the letter(s) specified and/or up to the first "*" are matched. For example, if you specify N*, all node names beginning with N are recognized as ACI nodes.
