

TRYALT - Try Alternative Server Address

This Natural profile parameter is for UNIX/OpenVMS and Windows platforms only.

Note for mainframes:

Use the keyword parameter TRYALT of the NTRPC macro for static specification, or the subparameter with the same name of the profile parameter RPC.

It determines whether an RPC client should try to execute an RPC request on an alternative server (ON) or not (OFF). For further information, see Specifying RPC Server Addresses in the Natural Remote Procedure Call documentation.

TRYALT is specified on the client side only.

Possible settings	ON	If a request could not be executed on the node you specified, the RPC client tries to find an alternative server address to send that request to.
	OFF	No such attempt will be made.
Default setting	OFF	
Dynamic specification	YES	
Specification within session	YES	At runtime, this value can be overwritten by the parameter maintenance of the SYSRPC utility.

For further information see the Natural Remote Procedure Call documentation.
