

MT - Maximum CPU Time

Note :

This parameter only applies to programs executing on mainframe computers in batch mode. The limit for programs operating in interactive mode is controlled by the TP monitor in use.

Parameter	Possible Values	Default Value	Applicable Statements
MT	see below	60 (seconds)	SET GLOBALS

With this parameter, you determine the maximum amount of CPU time which may be used by a Natural program. The value is specified in seconds.

MT=0 indicates that no CPU time limit is to be in effect.

The maximum value that can be used is determined by the operating system environment. Any value greater than the maximum will be reduced to the maximum supported by the operating system.

In system environments which do not support CPU time measurement, the limit is interpreted as elapsed time. In systems without timer support, the CPU time limit is ignored.

Example:

```
SET GLOBALS MT=5
```
