

UNCATALOG

Note:

This command is for UNIX/OpenVMS and Windows platforms only.

UNCATALOG [*object-name*]...

The UNCATALOG command is used to delete one or more object modules.

As *object-name*, you specify the name of the object to be deleted. You can only delete objects which are stored in the library to which you are currently logged on.

If more than one object is to be deleted, the *object-names* must be separated by one or more blanks (or the currently defined delimiter character).

If you wish to delete all objects whose names begin with a specific string of characters, use asterisk notation for the *object-name*.

If you enter the UNCATALOG command without an *object-name* or without an *object-name* but with an asterisk, a list of all cataloged objects in the current library will be displayed; on the list, you can then mark the object(s) to be deleted.

The contents of the source work area is not affected by the UNCATALOG command.

Note:

If an FDIC system file is specified in the parameter file which is not valid, Natural will display an appropriate error message when the UNCATALOG command is issued.
