

# Loading Messages - ERRLODUS

The program ERRLODUS is used to load messages previously unloaded with the program ERRULDUS.

The messages are read from Work File 2 and are written to the FNAT or FUSER system file. ERRLODUS overwrites existing messages on the system file if Replace was specified as **Y** when unloading.

If you specify ERRLODUS as ON, a list of all messages that were loaded (added or replaced) is output after loading has been completed.
