

OPF - Overwriting of Protected Fields by Helpfunctions

Parameter	Possible Values	Default Value	Applicable Statements
OPF	ON / OFF	ON	SET GLOBALS

This parameter determines whether the content of a write-protected field (attribute AD=P) can be overwritten by a helproutine assigned to the field.

OPF=ON	A helproutine assigned to a field can overwrite the field's content, even if the field is write-protected.
OPF=OFF	Helpfunctions cannot overwrite the contents of write-protected fields.

The OPF parameter only applies to the field for which a helproutine is invoked, it does not affect parameters explicitly passed to the helproutine. This means that the OPF parameter takes no effect if the field for which help is invoked is also explicitly specified as a parameter to be passed to the helproutine.
