

EJ - Page Eject

Parameter	Possible Values	Default Value	Applicable Statements
EJ	ON / OFF	ON	SET GLOBALS

With this session parameter, you determine whether a page eject is to be performed as a result of a logical page break, a break between program input and output, and the "normal end" message.

EJ=ON	A page eject will be performed.
EJ=OFF	A page eject will not be performed. This may be used to save paper during test runs, where page ejections are not needed.

The EJ setting may be overridden using the EJECT statement.

The EJ parameter only applies to the first report (report 0). For additional reports, the EJECT statement with report specification has to be used.

Example:

```
SET GLOBALS EJ=OFF
```
