

EDPSIZE - Size of Software AG Editor Auxiliary Buffer Pool

This Natural profile parameter is for mainframes only.

It determines the size of the auxiliary Software AG Editor buffer pool. It must be used when the Software AG Editor runs in a Sysplex environment. It allows the Software AG Editor to be run without a Software AG Editor (local or global) buffer pool.

Possible settings	0, or 32 - 32767	Buffer size in KB. If EDPSIZE is not zero, the auxiliary buffer pool is used although a (local or global) Software AG Editor buffer pool is defined with the NTBPI macro or BPI profile parameter.
Default setting	0	
Dynamic specification	YES	
Specification within session	NO	

No Software AG Editor work file is required for the auxiliary buffer pool.

When the auxiliary buffer pool is used, the Software AG Editor's recovery function is not available.

The auxiliary buffer pool storage is allocated exclusively for the user session. This means, that sufficient space in the user thread or in the region must be available.

For further information on the Software AG Editor, see Operating the Software AG Editor (in the Natural Operations for Mainframes documentation).
