

# PLOG - Logging of Dynamic Parameters

This Natural profile parameter is for mainframes and only applies in batch mode and under TSO.

It enables you to print a list of all profile parameters that were specified dynamically at the start of the session. This may be useful to ascertain which dynamic profile parameters were actually used, particularly if profile parameters like PROFILE or SYS are specified, which in turn "contain" other profile parameters (for a PROFILE or SYS parameter, the entire string of profile parameters activated by it is listed).

<b>Possible settings</b>	ON	At session start, a list of the dynamically specified profile parameters and their settings is written to the output dataset CMPLOG. (If CMPLOG is not available, the list is written to the standard output dataset, CMPRINT.)
	OFF	No list of dynamic profile parameters is written.
<b>Default setting</b>	OFF	
<b>Dynamic specification</b>	YES	See below.
<b>Specification within session</b>	NO	

When specified dynamically, the PLOG parameter applies to all subsequent dynamic profile parameters until the next PLOG specification. This allows you to exclude individual parameters from being printed, for example, if their settings contain passwords or other sensitive information that should not be printed.

All dynamic parameters which are specified between a PLOG=OFF specification and a subsequent PLOG=ON specification are not printed.
