

General Defaults Maintenance

Using the General Defaults maintenance sub-functions you can:

- see and modify the values of the Level Name, Prefix, Gen No and MCG options fields of applications;
- see and modify the four extended description skeletons: default descriptions of applications, migration events, maintenance requests and a default JCL text;
- maintain sets of Predict generation defaults;
- see and modify the default settings of applymods;
- see and modify the values of migration job, batch/online, workfile usage, and copy/move/include fields of migration paths.
- see and modify the values of some system parameters and the default user profile;
- see and set user exit switches.

To access the general defaults maintenance functions, enter Code G on the Administrator Functions menu.

The General Defaults menu appears:

```

17:40:39          ***** PREDICT APPLICATION CONTROL *****      2000-04-20
User SAGU          - General Defaults -
